# THE OVERDETERMINED CAUCHY PROBLEM FOR $\omega$-ULTRADIFFERENTIABLE FUNCTIONS 

CHIARA BOITI AND ELISABETTA GALLUCCI

#### Abstract

In this paper we study the Cauchy problem for overdetermined systems of linear partial differential operators with constant coefficients in some spaces of $\omega$-ultradifferentiable functions in the sense of Braun, Meise and Taylor BMT, for non-quasianalytic weight functions $\omega$. We show that existence of solutions of the Cauchy problem is equivalent to the validity of a Phragmén-Lindelöf principle for entire and plurisubharmonic functions on some irreducible affine algebraic varieties.

## 1. Introduction

In this paper we consider the Cauchy problem for overdetermined systems of linear partial differential operators with constant coefficients in some classes of $\omega$-ultradifferentiable functions, in the sense of Braun, Meise and Taylor BMT.

We consider a continuous increasing weight function $\omega:[0,+\infty) \rightarrow[0,+\infty)$ satisfying

$$
\begin{array}{ll}
(\alpha) & \exists K \geq 1: \omega(2 t) \leq K(1+\omega(t)) \quad \forall t \geq 0 \\
(\beta) & \int_{1}^{\infty} \frac{\omega(t)}{t^{2}} d t<\infty \\
(\gamma)^{\prime} & \exists a \in \mathbb{R}, b>0: \omega(t) \geq a+b \log (1+t) \quad \forall t \geq 0 \\
(\delta) & \varphi:[0, \infty) \rightarrow[0, \infty), \varphi(t):=\omega\left(e^{t}\right) \text { is convex. }
\end{array}
$$

With respect to weight functions considered in BMT, we weakened their condition

$$
\text { ( } \gamma) \lim _{t \rightarrow \infty} \frac{\log (1+t)}{\omega(t)}=0
$$

by condition $(\gamma)^{\prime}$ above, in the spirit of the original paper of Björck Bj]. For this reason in Section 2 we briefly retrace the paper of Braun, Meise and Taylor BMT, defining the spaces $\mathcal{E}_{\{\omega\}}$ and $\mathcal{E}_{(\omega)}$ of $\omega$-ultradifferentiable functions of Roumieu and Beurling type, but enlightening the results that are still valid with the weaker condition $(\gamma)^{\prime}$ and those ones which need the stronger condition $(\gamma)$ (cf. also [Fi, G]). It comes out that condition $(\gamma)$ is needed in the Roumieu case $\mathcal{E}_{\{\omega\}}$, while condition $(\gamma)^{\prime}$ is sufficient in the Beurling case $\mathcal{E}_{(\omega)}$; in particular, the space $\mathcal{E}(\Omega)$ of $\mathcal{C}^{\infty}$ functions on an open set $\Omega \subset \mathbb{R}^{N}$ can be viewed as $\mathcal{E}_{(\omega)}(\Omega)$ for $\omega(t)=\log (1+t)$. The utility of weakening condition $(\gamma)$ by condition $(\gamma)^{\prime}$ is clear, for instance, in the forthcoming paper [BJO], for the description of the space $\mathcal{S}_{\omega}$ of $\omega$-ultradifferentiable Schwartz functions.

In Section 3 we investigate the overdetermined Cauchy problem in the Beurling case. To be more precise, we settle the Cauchy problem in the frame of Whitney $\omega$-ultradifferentiable functions, in the spirit of (N2, BN1, BN3], in order to bypass the question of formal coherence of the data, which naturally arises in the overdetermined case.

Indeed, in the classical Cauchy problem for a linear partial differential equation with initial data on a hypersurface, smooth initial data together with the equation allow to compute the Taylor series of a smooth solution at any given point of the hypersurface.

This leads, in the case of systems of linear partial differential equations, to the notion of formally noncharacteristic hypersurface that was considered in AHLM, AN, N2.

In the case of overdetermined systems, the question of the formal coherence of the data would be particularly intricate, so that the above remarks suggest further generalizations of the Cauchy problem, where the assumption that the initial data are given on a formally non-characteristic hypersurface is dropped, and we allow formal solutions (in the sense of Whitney) of the given system on any closed subset as initial data.

[^0]Using Whitney functions, we can thus consider a more general framework in which two quite arbitrary sets are involved. We take $K_{1}$ and $K_{2}$ closed convex subsets of $\mathbb{R}^{N}$ with $K_{1} \subsetneq K_{2}$ and $\overline{K_{j}}=K_{j}$ for $j=1,2$, thinking at $K_{1}$ as the set where the initial data are given, and at $K_{2}$ as the set where we want to find a solution of the following Cauchy problem:

$$
\left\{\begin{array}{l}
A_{0}(D) u=f  \tag{1.1}\\
\left.u\right|_{K_{1}} \equiv \varphi
\end{array}\right.
$$

where $A_{0}(D)$ is an $a_{1} \times a_{0}$ matrix of linear partial differential operators with constant coefficients, $\varphi \in\left(W_{K_{1}}^{(\omega)}\right)^{a_{0}}$, $f \in\left(W_{K_{2}}^{(\omega)}\right)^{a_{1}}$ are the given Cauchy data in the Whitney classes of $\omega$-ultradifferentiable functions of Beurling type on $K_{1}$ and $K_{2}$ respectively, and $\left.u\right|_{K_{1}} \equiv \varphi$ means that they are equal in the Whitney sense, i.e. with all their derivatives.

It comes out (see Section 3) that, in order to find a solution $u \in\left(W_{K_{2}}^{(\omega)}\right)^{a_{0}}$ of the Cauchy problem (1.1), the function $f$ must satisfy some integrability conditions. These may be written as

$$
\left\{\begin{array}{l}
A_{1}(D) f=0  \tag{1.2}\\
\left.f\right|_{K_{1}} \equiv 0
\end{array}\right.
$$

for a matrix $A_{1}(D)$ of linear partial differential operators with constant coefficients obtained by a Hilbert resolution of $\mathcal{M}=\operatorname{coker}\left({ }^{t} A_{0}(\zeta): \mathcal{P}^{a_{1}} \rightarrow \mathcal{P}^{a_{0}}\right):$

$$
0 \longrightarrow \mathcal{P}^{a_{d}} \xrightarrow{{ }^{t} A_{d-1}(\zeta)} \mathcal{P}^{a_{d-1}} \longrightarrow \ldots \longrightarrow \mathcal{P}^{a_{2}} \xrightarrow{{ }^{t} A_{1}(\zeta)} \mathcal{P}^{a_{1}} \xrightarrow{{ }^{t} A_{0}(\zeta)} \mathcal{P}^{a_{0}} \longrightarrow \mathcal{M} \longrightarrow 0
$$

where $\mathcal{P}=\mathbb{C}\left[\zeta_{1}, \ldots, \zeta_{N}\right]$.
The rows of the matrix $A_{1}(D)$ give a system of generators for the module of all integrability conditions for $f$ that can be expressed in terms of partial differential operators, and if $A_{1}(\zeta) \not \equiv 0$ we say that the Cauchy problem is overdetermined.

We prove in Theorem 3.18 that the Cauchy problem (1.1), for $f$ satisfying (1.2), admits at least a solution if and only if the following Phragmén-Lindelöf principle holds for all $\wp \in \operatorname{Ass}(\mathcal{M})$ and $V=V(\wp)$ :

$$
(P h-L)_{\mathrm{psh}}\left\{\begin{array}{l}
\forall \alpha \in \mathbb{N}, \exists \beta \in \mathbb{N}, C>0 \text { such that } \\
\text { if } u \in \operatorname{psh}(V) \text { satisfies for some costants } \alpha_{u} \in \mathbb{N}, c_{u}>0 \\
\left\{\begin{array}{l}
u(\zeta) \leq H_{K_{\alpha}^{2}}^{2}(\operatorname{Im} \zeta)+\alpha \omega(\zeta), \quad \forall \zeta \in V \\
u(\zeta) \leq H_{K_{\alpha_{u}}^{1}}(\operatorname{Im} \zeta)+\alpha_{u} \omega(\zeta)+c_{u}, \quad \forall \zeta \in V \\
\text { then it also satisfies: } \\
u(\zeta) \leq H_{K_{\beta}^{1}}(\operatorname{Im} \zeta)+\beta \omega(\zeta)+C, \quad \forall \zeta \in V
\end{array}\right.
\end{array}\right.
$$

where $H_{K}$ is the supporting function of the compact set $K,\left\{K_{\alpha}^{j}\right\}_{\alpha}$ is a sequence of compact subsets of $K^{j}$ with $K_{\alpha}^{j} \subset \stackrel{\circ}{K}_{\alpha+1}^{j}$ and $K^{j}=\cup_{\alpha} K_{\alpha}^{j}$ for $j=1,2, V$ is the complex characteristic variety of $\mathcal{P} / \wp$ defined by

$$
\begin{equation*}
V=V(\wp):=\left\{\zeta \in \mathbb{C}^{N}: p(-\zeta)=0 \quad \forall p \in \wp\right\} \tag{1.3}
\end{equation*}
$$

and $\operatorname{psh}(V)$ is the set of all plurisubharmonic functions on $V$ (in the sense of Definition 3.19).
Relating the existence of solutions of the Cauchy problem to the validity of a Phragmén-Lindelöf principle may be very useful. For instance, in the case of a Gevrey weight $\omega(t)=t^{1 / s}, s>1$, it was found in BM] a complete characterization of algebraic curves V that satisfy the Phragmén-Lindelöf principle, by means of Puiseux series expansions on the branches of V at infinity: it comes out that the exponents and coefficients of the Puiseux series expansions are strictly related to the Gevrey order $s$. This implies that, looking at the Puiseux series expansions at infinity of the complex characteristic variety associated to the system $A_{0}(D)$, we can establish in which (small) Gevrey classes the Cauchy problem admits at least a solution and in which classes it doesn't work. Since Puiseux series expansions can be computed by several computer programs, such as MAPLE for instance, this characterization may be very useful.

## 2. Ultradifferentiable functions

In the present section we follow BMT, enlightening when condition $(\gamma)$ below can be weakened by condition $(\gamma)^{\prime}$ of Definition 2.3.

We recall, from BMT, the following:

Definition 2.1. Let $\omega:[0, \infty) \rightarrow[0, \infty)$ be a continuous increasing function. It will be called a nonquasianalytic weight function $\omega \in \mathcal{W}$ if it has the following properties:
$(\alpha) \exists K \geq 1: \omega(2 t) \leq K(1+\omega(t)) \quad \forall t \geq 0$,
( $\beta$ ) $\int_{1}^{\infty} \frac{\bar{\omega}(t)}{t^{2}} d t<\infty$,
( $\gamma) \lim _{t \rightarrow \infty} \frac{\log (1+t)}{\omega(t)}=0$,
( $\delta) \varphi:[0, \infty) \rightarrow[0, \infty), \varphi(t):=\omega\left(e^{t}\right)$ is convex.
For $z \in \mathbb{C}^{N}$ we write $\omega(z)$ for $\omega(|z|)$, where $|z|=\sum_{j=1}^{N}\left|z_{j}\right|$.
Remark 2.2. Condition $(\beta)$ is the condition of non-quasianalyticity and it will ensure, in the following, the existence of functions with compact support (cf. Remark 2.20).

It will be sometimes possible, and usefull (see BJO), to weaken condition $(\gamma)$ by the following:
Definition 2.3. Let $\omega:[0, \infty) \rightarrow[0, \infty)$ be a continuous increasing function. It will be called a nonquasianalytic weight function $\omega \in \mathcal{W}^{\prime}$ if it satisfies the conditions $(\alpha),(\beta),(\delta)$ and

$$
(\gamma)^{\prime} \quad \exists a \in \mathbb{R}, b>0: \omega(t) \geq a+b \log (1+t), \quad \forall t \geq 0
$$

Set again $\omega(z)=\omega(|z|)$ for $z \in \mathbb{C}^{N}$.
Then we can define the Young conjugate $\varphi^{*}$ of $\varphi$ by

$$
\begin{aligned}
\varphi^{*}:[0, \infty) & \longrightarrow \mathbb{R} \\
y & \longmapsto \sup _{x \geq 0}(x y-\varphi(x)) .
\end{aligned}
$$

There is no loss of generality to assume that $\omega$ vanishes on $[0,1]$ (cf. also AJO]). Then $\varphi^{*}$ has only nonnegative values, it is convex and increasing, satisfies $\varphi^{*}(0)=0$ and $\left(\varphi^{*}\right)^{*}=\varphi$ (cf. [BMT, BL]). Moreover if $\lim _{x \rightarrow \infty} \frac{x}{\varphi(x)}=0$ then $\lim _{y \rightarrow \infty} \frac{y}{\varphi^{*}(y)}=0$. Note that $(\gamma)$ implies $\lim _{x \rightarrow \infty} \frac{x}{\varphi(x)}=0$.
Example 2.4. The following functions $\omega \in \mathcal{W}^{\prime}$ are examples of non-quasianalytic weight functions (eventually after a change in the interval $[0, \delta]$ for suitable $\delta>0$ ):

$$
\begin{align*}
& \omega(t)=t^{\alpha}, \quad 0<\alpha<1  \tag{2.1}\\
& \omega(t)=(\log (1+t))^{\beta}, \quad \beta \geq 1  \tag{2.2}\\
& \omega(t)=t(\log (e+t))^{-\beta}, \quad \beta>1
\end{align*}
$$

They are all weight functions also in $\mathcal{W}$, except (2.2) for $\beta=1$ which satisfies $(\gamma)^{\prime}$ but not $(\gamma)$.
As in BMT, the following lemmas are valid for $\omega \in \mathcal{W}^{\prime}$ (see [G] for more details):
Lemma 2.5. Let $\omega \in \mathcal{W}^{\prime}$. Then

$$
\omega(x+y) \leq K(1+\omega(x)+\omega(y)), \quad \forall x, y \in \mathbb{C}^{N}
$$

Lemma 2.6. For $\omega \in \mathcal{W}^{\prime}$ and $\varphi(t)=\omega\left(e^{t}\right)$, there exists $L>0$ such that

$$
\varphi^{*}(y)-y \geq L \varphi^{*}\left(\frac{y}{L}\right)-L, \quad \forall y \geq 0
$$

Lemma 2.7. For $\omega \in \mathcal{W}^{\prime}$ and $\varphi(t)=\omega\left(e^{t}\right)$ we have that $\frac{\varphi(x)}{x}$ and $\frac{\varphi^{*}(s)}{s}$ are increasing.
Lemma 2.8. Let $\omega \in \mathcal{W}^{\prime}$. Then there exists a weight function $\sigma \in \mathcal{W}$ with $\omega(t)=o(\sigma(t))$.
On the contrary, for the following results of [BMT], the condition $\omega \in \mathcal{W}$ is needed:
Lemma 2.9. Let $\omega \in \mathcal{W}$ and $g:[0, \infty) \rightarrow[0, \infty)$ satisfying $g(t)=o(\omega(t))$ as tends to $\infty$. Then there exists $\sigma \in \mathcal{W}$ with the following properties:
(i) $g(t)=o(\sigma(t))$ as $t \rightarrow \infty$,
(ii) $\sigma(t)=o(\omega(t))$ as $t \rightarrow \infty$,
(iii) $\forall A>1: \quad \limsup _{t \rightarrow \infty} \frac{\sigma(A t)}{\sigma(t)} \leq \limsup _{t \rightarrow \infty} \frac{\omega(A t)}{\omega(t)}$.

If, in addition, there is $R \geq 1$ such that $\left.\omega\right|_{[R, \infty)}$ is concave, then it is possible to make $\left.\sigma\right|_{[R, \infty)}$ concave, too.

Remark 2.10. (1) If $\omega$ is a quasianalytic weight, i.e. $\omega \in \mathcal{W}$ is a weight function except that it doesn't satisfy $(\beta)$, then the function $\sigma$ can be constructed as above, except that it may not satisfy $(\beta)$.
(2) We can construct $\sigma$ so that it coincides with $\omega$ on a given arbitrarily large bounded interval.
(3) If $\omega, \rho \in \mathcal{W}$ are concave on $(R, \infty)$, with $\rho=o(\omega)$, then for each $D>0$ there is a weight function $\sigma$, as in Lemma 2.9, with the additional property that $\sigma \equiv \rho$ on $[0, D]$.

Proposition 2.11. Let $\omega \in \mathcal{W}$ and, for $j \in \mathbb{N}$, let $g_{j}:[0,+\infty) \rightarrow[0,+\infty)$ satisfying $g_{j}(t)=o(\omega(t))$ as $t$ tends to $\infty$. Then there exists $\sigma \in \mathcal{W}$ with the following properties:
(i) $\lim _{t \rightarrow \infty} \frac{g_{j}(t)}{\sigma(t)}=0 \quad \forall j \in \mathbb{N}$,
(ii) $\lim _{t \rightarrow \infty} \frac{\sigma(t)}{\omega(t)}=0$,
(iii) $\forall A>1: \quad \limsup _{t \rightarrow \infty} \frac{\sigma(A t)}{\sigma(t)} \leq \limsup _{t \rightarrow \infty} \frac{\omega(A t)}{\omega(t)}$.

Lemma 2.12. Let $\omega \in \mathcal{W}$. Then there exists a nonzero function $g \in \mathcal{S}(\mathbb{R})$ with support in $(-\infty, 0]$ for which the Fourier transform $\widehat{g}$ satisfies

$$
|\widehat{g}(x)| \leq e^{-2 K \omega(x)} \quad \forall x \in \mathbb{R}
$$

where $K$ denotes the constant in $(\alpha)$.
Proposition 2.13. Let $\omega \in \mathcal{W}$. Then for every $\varepsilon>0$ there exists $h \in \mathcal{C}^{\infty}(\mathbb{R}), h \neq 0$, with

$$
\begin{aligned}
& \operatorname{supp}(h) \subset[-\varepsilon, \varepsilon] \\
& \int_{-\infty}^{+\infty}|\hat{h}(x)| e^{\omega(x)} d x<\infty
\end{aligned}
$$

However, the following two propositions for the existence of functions with compact support are valid also for $\omega \in \mathcal{W}^{\prime}$ :

Proposition 2.14. Let $\omega \in \mathcal{W}^{\prime}$. Then for each $N \in \mathbb{N}$ there exists $\delta_{N}>0$ such that for every $\varepsilon>0$ there exists $H \in \mathcal{C}^{\infty}\left(\mathbb{R}^{N}\right), H \neq 0$, with

$$
\begin{aligned}
& \operatorname{supp}(H) \subset[-\varepsilon, \varepsilon]^{N} \\
& \int_{\mathbb{R}^{N}}|\hat{H}(T)| e^{\delta_{N} \omega(t)} d t<\infty
\end{aligned}
$$

Proof. See BMT, Corollary 2.5 and Remark after Corollary 2.6.
Proposition 2.15. Let $\omega \in \mathcal{W}^{\prime}$. Then for each $N \in \mathbb{N}$ and $\varepsilon>0$ there exists $H \in \mathcal{C}^{\infty}\left(\mathbb{R}^{N}\right)$, $H \neq 0$, with

$$
\begin{aligned}
& \operatorname{supp}(H) \subset[-\varepsilon, \varepsilon]^{N} \\
& \int_{\mathbb{R}^{N}}|\hat{H}(T)| e^{m \omega(t)} d t<\infty, \quad \forall m>0
\end{aligned}
$$

Proof. See BMT, Corollary 2.6 and the related Remark.
The difference, in the next two lemmas, between taking $\omega \in \mathcal{W}$ or $\omega \in \mathcal{W}^{\prime}$, will be crucial in the sequel for the choice of $\omega \in \mathcal{W}$ when defining the space of $\omega$-ultradifferentiable functions of Roumieu type and $\omega \in \mathcal{W}^{\prime}$ for defining the space of $\omega$-ultradifferentiable functions of Beurling type.
Lemma 2.16. Let $\omega \in \mathcal{W}$ and let $f \in \mathcal{D}\left(\mathbb{R}^{N}\right)$. If there exists $B>0$ such that

$$
\int_{\mathbb{R}^{N}}|\hat{f}(t)| e^{B \omega(t)} d t:=C<\infty
$$

then

$$
\begin{equation*}
\sup _{\alpha \in \mathbb{N}_{0}^{N} x \in \mathbb{R}^{N}} \sup _{x}\left|f^{(\alpha)}(x)\right| e^{-B \varphi^{*}\left(\frac{|\alpha|}{B}\right)} \leq \frac{C}{(2 \pi)^{N}} \tag{2.3}
\end{equation*}
$$

If (2.3) holds for $f \in \mathcal{D}\left(\mathbb{R}^{N}\right)$ and $B>0$ then there is $D>0$, depending only on $\omega, N$ and $B$, and there is $L>0$ depending only on $\omega$ and $N$, such that for $K=\operatorname{supp} f$ and $m_{N}(K)$ its Lebesgue measure, we have that

$$
|\hat{f}(z)| \leq m_{N}(K) \frac{C D}{(2 \pi)^{N}} e^{\left(H_{K}(\operatorname{Im} z)-\frac{B}{L} \omega(z)\right)} \quad \forall z \in \mathbb{C}^{N}
$$

Proof. See BMT, Lemma 3.3.
Lemma 2.17. Let $\omega \in \mathcal{W}^{\prime}$ and $f \in \mathcal{D}\left(\mathbb{R}^{N}\right)$. If there is $B>0$ such that

$$
\int_{\mathbb{R}^{N}}|\hat{f}(t)| e^{B \omega(t)} d t:=C<\infty
$$

then

$$
\begin{equation*}
\sup _{\alpha \in \mathbb{N}_{0}^{N}} \sup _{x \in \mathbb{R}^{N}}\left|f^{(\alpha)}(x)\right| e^{-B \varphi^{*}\left(\frac{|\alpha|}{B}\right)} \leq \frac{C}{(2 \pi)^{N}} . \tag{2.4}
\end{equation*}
$$

If (2.4) holds for $f \in \mathcal{D}\left(\mathbb{R}^{N}\right)$ and $B>0$ then there is $D>0$, depending only on $\omega, N$ and $B$, and there is $L>0$ depending only on $\omega$ and $N$, such that for $K=\operatorname{supp} f$ and $m_{N}(K)$ its Lebesgue measure, we have that

$$
\begin{equation*}
|\hat{f}(z)| \leq m_{N}(K) \frac{C D}{(2 \pi)^{N}} e^{\left(H_{K}(\operatorname{Im} z)+\left(\frac{1}{b}-\frac{B}{L}\right) \omega(z)\right)} \quad \forall z \in \mathbb{C}^{N} \tag{2.5}
\end{equation*}
$$

where $b>0$ is the constant of condition $(\gamma)^{\prime}$ in Definition 2.3.
Proof. The proof of (2.4) is the same of that of (2.3) in Lemma 2.16 (see [BMT, Lemma 3.3]). So we prove (2.5).

By condition $(\alpha)$ there is $L>0$ such that

$$
\begin{equation*}
\omega(N r) \leq L \omega(r)+L \quad \forall r>0 \tag{2.6}
\end{equation*}
$$

Let now $z \in \mathbb{C}^{N}$ be given, let $l$ be the index with

$$
\left|z_{l}\right|=\max _{1 \leq j \leq N}\left|z_{j}\right|
$$

and assume $\left|z_{l}\right|>1$. Write then

$$
\hat{f}(z)=\int_{K} f(t) e^{-i<t, z>} d t=\int_{K}\left(\frac{\partial^{j}}{\partial t_{l}^{j}} f(t)\right) \cdot \frac{1}{\left(i z_{l}\right)^{j}} \cdot e^{-i<t, z>} d t
$$

by partial integration, for all $j \in \mathbb{N}_{0}:=\mathbb{N} \cup\{0\}$.
In view of (2.4), this implies that, for all $j \in \mathbb{N}_{0}$ :

$$
\begin{equation*}
|\hat{f}(z)| \leq m_{N}(K) \frac{C}{(2 \pi)^{N}} e^{\left(B \varphi^{*}\left(\frac{j}{B}\right)-j \log \left|z_{l}\right|+H_{K}(\operatorname{Im} z)\right)} \tag{2.7}
\end{equation*}
$$

Now, note that for every $x>0$ there exists $j \in \mathbb{N}_{0}$ such that $j \leq B x<j+1$, and hence from (2.6) and ( $\left.\gamma\right)^{\prime}$

$$
\begin{align*}
\sup _{j \in \mathbb{N}_{0}}\left(j \log \left|z_{l}\right|-B \varphi^{*}\left(\frac{j}{B}\right)\right) & =B \sup _{j \in \mathbb{N}_{0}}\left(\frac{j+1}{B} \log \left|z_{l}\right|-\varphi^{*}\left(\frac{j}{B}\right)\right)-\log \left|z_{l}\right| \\
& \geq B \sup _{x>0}\left(x \log \left|z_{l}\right|-\varphi^{*}(x)\right)-\log \left|z_{l}\right| \\
& =B \varphi^{* *}\left(\log \left|z_{l}\right|\right)-\log \left|z_{l}\right| \\
& =B \omega\left(z_{l}\right)-\log \left|z_{l}\right| \\
& \geq B \omega\left(\frac{z}{N}\right)-\log |z| \\
& \geq \frac{B}{L} \omega(z)-1-\log |z| \\
& \geq \frac{B}{L} \omega(z)-1-\frac{\omega(z)}{b}+\frac{a}{b} \\
& =\left(\frac{B}{L}-\frac{1}{b}\right) \omega(z)+\left(\frac{a}{b}-1\right) \tag{2.8}
\end{align*}
$$

By passing to the infimum over all $j \in \mathbb{N}_{0}$ in (2.7) and by using (2.8) we obtain:

$$
\begin{aligned}
|\hat{f}(z)| & \leq m_{N}(K) \frac{C}{(2 \pi)^{N}} e^{\left\{\left(\frac{1}{b}-\frac{B}{L}\right) \omega(z)+\left(1-\frac{a}{b}\right)+H_{K}(\operatorname{Im} z)\right\}} \\
& =m_{N}(K) \frac{C D}{(2 \pi)^{N}} e^{\left\{\left(\frac{1}{b}-\frac{B}{L}\right) \omega(z)+H_{K}(\operatorname{Im} z)\right\}}
\end{aligned}
$$

where $D=e^{\left(1-\frac{a}{b}\right)}$.

Definition 2.18. Let $\omega \in \mathcal{W}$ and let $K \subset \mathbb{R}^{N}$ be a compact set. For $\lambda>0$ we define the Banach space

$$
\begin{equation*}
\mathcal{D}_{\lambda}(K)=\left\{f \in \mathcal{C}^{\infty}\left(\mathbb{R}^{N}\right) \mid \operatorname{supp} f \subset K \text { and }\|f\|_{\lambda}:=\int_{\mathbb{R}^{N}}|\hat{f}(t)| e^{\lambda \omega(t)} d t<\infty\right\} \tag{2.9}
\end{equation*}
$$

We set

$$
\mathcal{D}_{\{\omega\}}(K)=\underset{\lambda \rightarrow 0}{\operatorname{ind} \lim _{\lambda}} \mathcal{D}_{\lambda}(K)
$$

endowed with the topology of the inductive limit.
For an open set $\Omega \subset \mathbb{R}^{N}$ we define then

$$
\mathcal{D}_{\{\omega\}}(\Omega)=\operatorname{ind}_{K \subset \subset \Omega} \lim _{\{ } \mathcal{D}_{\{\omega\}}(K)
$$

where the inductive limit is taken over all compact subsets $K$ of $\Omega$. We endow $\mathcal{D}_{\{\omega\}}(\Omega)$ with the inductive limit topology.

The elements of $\mathcal{D}_{\{\omega\}}(\Omega)$ are called $\omega$-ultradifferentiable functions of Roumieu type with compact support.
Definition 2.19. Let $\omega \in \mathcal{W}^{\prime}$ and let $K \subset \mathbb{R}^{N}$ be a compact set.
For $\mathcal{D}_{\lambda}(K)$ defined as in (2.9), we set

$$
\mathcal{D}_{(\omega)}(K)=\underset{\lambda \rightarrow \infty}{\operatorname{proj} \lim } \mathcal{D}_{\lambda}(K)
$$

endowed with the topology of the projective limit.
For an open set $\Omega \subset \mathbb{R}^{N}$ we define

$$
\mathcal{D}_{(\omega)}(\Omega)=\operatorname{ind}_{K \subset \subset \Omega} \lim _{\mathcal{D}} \mathcal{D}_{(\omega)}(K)
$$

where the inductive limit is taken over all compact subsets of $\Omega$. We endow $\mathcal{D}_{(\omega)}(\Omega)$ with the inductive limit topology.

The elements of $\mathcal{D}_{(\omega)}(\Omega)$ are called $\omega$-ultradifferentiable functions of Beurling type with compact support.
Remark 2.20. As in BMT, we have the following:
(1) Let $K \subset \mathbb{R}^{N}$ with non-empty interior. If $\omega \in \mathcal{W}^{\prime}$ then $\mathcal{D}_{(\omega)}(K) \neq\{0\}$; if $\omega \in \mathcal{W}$ then $\mathcal{D}_{\{\omega\}}(K) \neq\{0\}$ and moreover $\mathcal{D}_{(\omega)}(K) \subset \mathcal{D}_{\{\omega\}}(K)$.
(2) For $\omega, \sigma \in \mathcal{W}^{\prime}$ we have that $\mathcal{D}_{(\omega)}(\mathbb{R}) \subset \mathcal{D}_{(\sigma)}(\mathbb{R})$ iff $\sigma=O(\omega)$.
(3) We say that two functions $\omega$ and $\sigma$ are equivalent if $\omega=O(\sigma)$ and $\sigma=O(\omega)$. Note that if $\omega \leq \sigma \leq C \omega$ for some $C>0$ and if $\psi(x)=\sigma\left(e^{x}\right)$, then

$$
C \varphi^{*}\left(\frac{y}{C}\right) \leq \psi^{*}(y) \leq \varphi^{*}(y) \quad \forall y>0
$$

With this formula, it's easy to see that definitions and most theorems in the sequel don't change if $\omega$ is only equivalent to a weight function.

Lemmas 2.16 and 2.17 and the classical Paley-Wiener Theorem for $\mathcal{D}(K)$ imply the following Paley-Wiener theorems for $\omega$ - ultradifferentiable functions:

Theorem 2.21 (Paley-Wiener Theorem for $\omega$-ultradifferentiable functions of Roumieu type). Let $\omega \in \mathcal{W}$, $K \subset \mathbb{R}^{N}$ a convex compact set and $f \in L^{1}\left(\mathbb{R}^{N}\right)$. The following are equivalent:
(1) $f \in \mathcal{D}_{\{\omega\}}(K)$,
(2) $f \in \mathcal{D}(K)$ and for some $k \in \mathbb{N}$

$$
\sup _{\alpha \in \mathbb{N}_{0}^{N}} \sup _{x \in \mathbb{R}^{N}}\left|f^{(\alpha)}(x)\right| e^{\left(-\frac{1}{k} \varphi^{*}(|\alpha| k)\right)}<\infty
$$

(3) there exist $\varepsilon, C>0$ such that

$$
|\hat{f}(z)| \leq C e^{\left(H_{K}(\operatorname{Im} z)-\varepsilon \omega(z)\right)} \quad \forall z \in \mathbb{C}^{N}
$$

Proof. See BMT, Prop. 3.4], or [G] for more details.
Theorem 2.22 (Paley-Wiener Theorem for $\omega$-ultradifferentiable functions of Beurling type). Let $\omega \in \mathcal{W}^{\prime}, K$ $\subset \mathbb{R}^{N}$ a convex compact set and $f \in L^{1}\left(\mathbb{R}^{N}\right)$. The following are equivalent:
(1) $f \in \mathcal{D}_{(\omega)}(K)$,
(2) $f \in \mathcal{D}(K)$ and for all $k \in \mathbb{N}$

$$
\sup _{\alpha \in \mathbb{N}_{0}^{N}} \sup _{x \in \mathbb{R}^{N}}\left|f^{(\alpha)}(x)\right| e^{\left(-k \varphi^{*}\left(\frac{|\alpha|}{k}\right)\right)}<\infty
$$

(3) for all $k \in \mathbb{N}$ there is $C_{k}>0$ such that

$$
|\hat{f}(z)| \leq C_{k} e^{\left(H_{K}(\operatorname{Im} z)-k \omega(z)\right)} \quad \forall z \in \mathbb{C}^{N}
$$

Proof. (1) $\Rightarrow(2)$ :
If $f \in \mathcal{D}_{(\omega)}(K)$ then, by definition, $f \in \mathcal{D}(K)$ and for every $\varepsilon>0$

$$
\int_{\mathbb{R}^{N}}|\hat{f}(t)| e^{\varepsilon \omega(t)} d t=: C_{\varepsilon}<\infty
$$

So, by Lemma 2.17, for all $\varepsilon>0$

$$
\begin{equation*}
\sup _{\alpha \in \mathbb{N}_{0}^{N}} \sup _{x \in \mathbb{R}^{N}}\left|f^{(\alpha)}(x)\right| e^{\left(-\varepsilon \varphi^{*}\left(\frac{|\alpha|}{\varepsilon}\right)\right)}<\infty \tag{2.10}
\end{equation*}
$$

and hence (2), since $\frac{\varphi^{*}(x)}{x}$ is increasing.
$(2) \Rightarrow(3):$
If $f \in \mathcal{D}(K)$ satisfies (2) then it also satisfies (2.10) for every $\varepsilon>0$ since $\varphi^{*}(s) / s$ is increasing, and hence, by Lemma 2.17 there exists $D_{\varepsilon}>0$ such that

$$
\begin{equation*}
|\hat{f}(z)| \leq D_{\varepsilon} e^{\left(H_{K}(\operatorname{Im} z)+\left(\frac{1}{b}-\frac{\varepsilon}{L}\right) \omega(z)\right)} \tag{2.11}
\end{equation*}
$$

Therefore for every $\tilde{\varepsilon}>0$ we can choose

$$
\varepsilon=L\left(\tilde{\varepsilon}+\frac{1}{b}\right)>0
$$

in (2.10), so that (2.11) becomes

$$
|\hat{f}(z)| \leq D_{\varepsilon} e^{\left(H_{K}(\operatorname{Im} z)-\tilde{\varepsilon} \omega(z)\right)}
$$

and hence (3).
$(3) \Rightarrow(1):$
By (3) and $(\gamma)^{\prime}$ we have that for all $\lambda>0$, taking $k \in \mathbb{N}$ with $k>\lambda$, there exist $C_{\lambda}, C_{\lambda}^{\prime}>0$ such that

$$
\begin{align*}
\int_{\mathbb{R}^{N}}|\hat{f}(t)| e^{\lambda \omega(t)} d t & \leq C_{\lambda} \int_{\mathbb{R}^{N}} e^{(-k+\lambda) \omega(t)} d t \\
& \leq C_{\lambda} \int_{\mathbb{R}^{N}} e^{(-k+\lambda)(a+b \log (1+t))} d t  \tag{2.12}\\
& =C_{\lambda}^{\prime} \int_{\mathbb{R}^{N}}(1+t)^{b(\lambda-k)} d t
\end{align*}
$$

For $k>\frac{N+1}{b}+\lambda$ the above integral is finite and hence there exists $C_{\lambda}^{\prime \prime}>0$ such that

$$
\int_{\mathbb{R}^{N}}|\hat{f}(t)| e^{\lambda \omega(t)} d t \leq C_{\lambda}^{\prime \prime}
$$

To prove that $f \in \mathcal{D}(K)$ note that (3) and $(\gamma)^{\prime}$ imply that for every $k \in \mathbb{N}$ there exists $C_{k}>0$ such that

$$
\begin{aligned}
|\hat{f}(z)| & \leq C_{k} e^{H_{K}(\operatorname{Im} z)-k \omega(z)} \\
& \leq C_{k} e^{H_{K}(\operatorname{Im} z)-k(a+b \log (1+|z|))} \\
& =C_{k} e^{-a k} e^{H_{K}(\operatorname{Im} z)}(1+|z|)^{-b k} \quad \forall z \in \mathbb{C}^{N} .
\end{aligned}
$$

Therefore for every $n \in \mathbb{N}$ there exists $C_{n}>0$ such that

$$
|\hat{f}(z)| \leq C_{n} e^{H_{K}(\operatorname{Im} z)}(1+|z|)^{-n} \quad \forall z \in \mathbb{C}^{N}
$$

By the classical Paley-Wiener Theorem we finally have that $f \in \mathcal{D}(K)$ and hence the theorem is proved.
Remark 2.23. The inequality (2.12) enlightens the sufficiency of condition $(\gamma)^{\prime}$ on the weight $\omega$ : by the arbitrariety of $\lambda$ we can allow a fixed $b>0$ to make the integral convergent. On the contrary, in the Roumieu case (Theorem 2.21) we need condition $(\gamma)$, i.e. $\log (1+t)=o(\omega(t))$ as $t \rightarrow+\infty$, since $\lambda$ is fixed.

For a sequence $\mathbb{P}=\left(p_{n}\right)_{n \in \mathbb{N}}$ of continuous functions $p_{n}: \mathbb{C}^{N} \rightarrow \mathbb{R}$, we define

$$
A_{\mathbb{P}}\left(\mathbb{C}^{N}\right):=\left\{f \in \mathcal{O}\left(\mathbb{C}^{N}\right) \mid \text { for some } n: \sup _{z \in \mathbb{C}^{N}}|f(z)| e^{-p_{n}(z)}<\infty\right\}
$$

and

$$
A_{\mathbb{P}}^{0}\left(\mathbb{C}^{N}\right):=\left\{f \in \mathcal{O}\left(\mathbb{C}^{N}\right) \mid \text { for all } n: \sup _{z \in \mathbb{C}^{N}}|f(z)| e^{-p_{n}(z)}<\infty\right\}
$$

where $\mathcal{O}\left(\mathbb{C}^{N}\right)$ is the set of all entire functions on $\mathbb{C}^{N}$.
Let $\omega$ be a weight function and $K \subset \mathbb{R}^{N}$ a convex compact set. Define

$$
\mathbb{P}_{K}:=\left\{p_{n}: z \mapsto H_{K}(\operatorname{Im} z)-\frac{1}{n} \omega(z), n \in \mathbb{N}\right\}
$$

and

$$
\mathbb{M}_{K}:=\left\{m_{n}: z \mapsto H_{K}(\operatorname{Im} z)-n \omega(z), n \in \mathbb{N}\right\}
$$

For an open convex set $\Omega \subset \mathbb{R}^{N}$ and a convex compact exhaustion $\stackrel{\circ}{K}_{1} \subset \dot{K}_{2} \subset \dot{K}_{3}^{\circ} \subset \ldots$ of $\Omega$, define also

$$
\mathbb{P}_{\Omega}:=\left\{p_{n}: z \mapsto H_{K_{n}}(\operatorname{Im} z)-\frac{1}{n} \omega(z), n \in \mathbb{N}\right\}
$$

From the Paley-Wiener Theorems 2.21t2.22 (cf. also BMT, Prop. 3.5]) we get:
Proposition 2.24. We have the following:
(1) Let $K$ be a compact convex set of $\mathbb{R}^{N}$. Then:
(a) if $\omega \in \mathcal{W}$

$$
\mathcal{D}_{\{\omega\}}(K) \cong A_{\mathbb{P}_{K}}\left(\mathbb{C}^{N}\right)
$$

(b) if $\omega \in \mathcal{W}^{\prime}$

$$
\mathcal{D}_{(\omega)}(K) \cong A_{\mathbb{M}_{K}}^{0}\left(\mathbb{C}^{N}\right)
$$

(2) For $\omega \in \mathcal{W}, \Omega \subset \mathbb{R}^{N}$ an open convex set:

$$
\mathcal{D}_{\{\omega\}}(\Omega) \cong A_{\mathbb{P}_{\Omega}}\left(\mathbb{C}^{N}\right)
$$

The isomorphisms are given by the Fourier-Laplace transform.
As in BMT, we can collect some more properties on these spaces of $\omega$-ultradifferentiable functions with compact support, taking $\omega \in \mathcal{W}^{\prime}$ in the Beurling case and $\omega \in \mathcal{W}$ in the Roumieu case.

Corollary 2.25. Let $K \subset \mathbb{R}^{N}$ be compact and $\Omega \subset \mathbb{R}^{N}$ be open.
(1) Let $\omega \in \mathcal{W}$. Then $\mathcal{D}_{\{\omega\}}(K)$ is a (DFN)-space, i.e. the strong dual of a nuclear Fréchet space. In particular, it's complete, reflexive and nuclear.
(2) Let $\omega \in \mathcal{W}^{\prime}$. Then $\mathcal{D}_{(\omega)}(K)$ is a (FN)-space, i.e. a nuclear Fréchet space.

Lemma 2.26. Let $\omega \in \mathcal{W}, f \in \mathcal{D}\left(\mathbb{R}^{N}\right), g \in \mathcal{D}_{\{\omega\}}\left(\mathbb{R}^{N}\right)$. Then we have:
(1) $\left\{_{\{\omega\}} \quad f * g \in \mathcal{D}_{\{\omega\}}\left(\mathbb{R}^{N}\right)\right.$,
(2) $)_{\{\omega\}} \quad \operatorname{supp}(f * g) \subset \operatorname{supp} f+\operatorname{supp} g$,
$(3)_{\{\omega\}} \quad \widehat{f * g}(z)=\hat{f}(z) \hat{g}(z)$.
Let $\omega \in \mathcal{W}^{\prime}, f \in \mathcal{D}\left(\mathbb{R}^{N}\right), g \in \mathcal{D}_{(\omega)}\left(\mathbb{R}^{N}\right)$. Then we have:
$(1)_{(\omega)} \quad f * g \in \mathcal{D}_{(\omega)}\left(\mathbb{R}^{N}\right)$,
(2) $(\omega) \quad \operatorname{supp}(f * g) \subset \operatorname{supp} f+\operatorname{supp} g$,
$(3)_{(\omega)} \quad \widehat{f * g}(z)=\hat{f}(z) \hat{g}(z)$.
Lemma 2.27. Let $K_{1}, K_{2} \subset \mathbb{R}^{N}$ be compact sets with $K_{1} \subset \dot{K}_{2}$.
(a) Let $\omega, \sigma \in \mathcal{W}$ with $\sigma \leq \omega$. Then for all $f \in \mathcal{D}_{\{\sigma\}}\left(K_{1}\right)$ there is a sequence $\left\{f_{n}\right\}_{n \in \mathbb{N}}$ in $\mathcal{D}_{\{\omega\}}\left(K_{2}\right)$ with $\lim _{n \rightarrow \infty} f_{n}=f$ in $\mathcal{D}_{\{\sigma\}}\left(K_{2}\right)$.
(b) Let $\omega, \sigma \in \mathcal{W}^{\prime}$ with $\sigma \leq \omega$. Then for all $f \in \mathcal{D}_{(\sigma)}\left(K_{1}\right)$ there is a sequence $\left\{f_{n}\right\}_{n \in \mathbb{N}}$ in $\mathcal{D}_{(\omega)}\left(K_{2}\right)$ with $\lim _{n \rightarrow \infty} f_{n}=f$ in $\mathcal{D}_{(\sigma)}\left(K_{2}\right)$.
(c) Let $\omega \in \mathcal{W}^{\prime}$. Then for all $f \in \mathcal{D}\left(K_{1}\right)$ there is a sequence $\left\{f_{n}\right\}_{n \in \mathbb{N}}$ in $\mathcal{D}_{(\omega)}\left(K_{2}\right)$ with $\lim _{n \rightarrow \infty} f_{n}=f$ in $\mathcal{D}\left(K_{2}\right)$.

Proposition 2.28. Let $\omega, \sigma \in \mathcal{W}$ with $\sigma=o(\omega)$. Then the inclusions

$$
\mathcal{D}_{(\omega)}(\Omega) \hookrightarrow \mathcal{D}_{\{\omega\}}(\Omega) \hookrightarrow \mathcal{D}_{(\sigma)}(\Omega) \hookrightarrow \mathcal{D}(\Omega)
$$

are continuous and sequentially dense for each open set $\Omega \subset \mathbb{R}^{N}$.
Let us now introduce the algebras of $\omega$-ultradifferentiable functions of Beurling and of Roumieu type with arbitrary support. Here again we need $\omega \in \mathcal{W}$ in the Roumieu case, while we can allow $\omega \in \mathcal{W}^{\prime}$ in the Beurling case.

Definition 2.29. For $\omega \in \mathcal{W}$ and an open set $\Omega \subset \mathbb{R}^{N}$, we define

$$
\begin{aligned}
\mathcal{E}_{\{\omega\}}(\Omega):= & \left\{f \in \mathcal{C}^{\infty}(\Omega) \mid \text { for all compact } K \subset \Omega \text { there is } m \in \mathbb{N}\right. \text { with } \\
& \left.\sup _{\alpha \in \mathbb{N}_{0}^{N} x \in K} \sup \left|f^{(\alpha)}(x)\right| e^{\left(-\frac{1}{m} \varphi^{*}(m|\alpha|)\right)}<\infty\right\} .
\end{aligned}
$$

For $\omega \in \mathcal{W}^{\prime}$ and an open set $\Omega \subset \mathbb{R}^{N}$ we define

$$
\begin{aligned}
\mathcal{E}_{(\omega)}(\Omega):= & \left\{f \in \mathcal{C}^{\infty}(\Omega) \mid \text { for all compact } K \subset \Omega \text { and all } m \in \mathbb{N}\right. \\
& \left.p_{K, m}(f):=\sup _{\alpha \in \mathbb{N}_{0}^{N} x \in K} \sup _{x}\left|f^{(\alpha)}(x)\right| e^{\left(-m \varphi^{*}\left(\frac{|\alpha|}{m}\right)\right)}<\infty\right\}
\end{aligned}
$$

The topology of $\mathcal{E}_{\{\omega\}}(\Omega)$ is given by first taking the inductive limit over all $m \in \mathbb{N}$ for each compact $K \subset \Omega$ and then taking the projective limit for $K \subset \Omega$, while $\mathcal{E}_{(\omega)}(\Omega)$ carries the metric locally convex topology given by the seminorms $p_{K, m}$ where $K$ is a compact subset of $\Omega$ and $m \in \mathbb{N}$.

The elements of $\mathcal{E}_{\{\omega\}}(\Omega)$ are called $\omega$-ultradifferentiable functions of Roumieu type, while the elements of $\mathcal{E}_{(\omega)}(\Omega)$ are called $\omega$-ultradifferentiable functions of Beurling type.

Notation. We shall write $\mathcal{E}_{*}\left(\right.$ resp. $\left.\mathcal{D}_{*}\right)$ if a statements holds for both $\mathcal{E}_{\{\omega\}}\left(\right.$ resp. $\left.\mathcal{D}_{\{\omega\}}\right)$ and $\mathcal{E}_{(\omega)}\left(\right.$ resp. $\left.\mathcal{D}_{(\omega)}\right)$, taking $\omega \in \mathcal{W}$ in the Roumieu case and $\omega \in \mathcal{W}^{\prime}$ in the Beurling case.
Example 2.30. For $\omega$ as in (2.1) the space $\mathcal{E}_{\{\omega\}}(\Omega)$ is the classical Gevrey class of order $\frac{1}{\alpha}$. For $\omega$ as in (2.2) with $\beta=1$, the space $\mathcal{E}_{(\omega)}(\Omega)$ is the space $\mathcal{E}(\Omega)$ of $\mathcal{C}^{\infty}$ functions in $\Omega$.
Remark 2.31. In general the spaces of $\omega$-ultradifferentiable functions defined as in Definition 2.29 are different from the Denjoy-Carleman classes of ultradifferentiable functions as defined in K (cf. BMM]).

As in [BMT], we have the following properties of the spaces $\mathcal{E}_{*}(\Omega)$ :
Proposition 2.32. $\mathcal{E}_{*}(\Omega)$ is a locally convex algebra with continuous moltiplication.
Lemma 2.33. Let $\Omega \subset \mathbb{R}^{N}$ be open, let $K_{1} \subset K_{2} \subset K_{2} \subset \ldots \subset \Omega$ be an exhaustion of $\Omega$ by compact sets, choose $\chi_{j} \in \mathcal{D}_{*}\left(K_{j}\right)$ with $0 \leq \chi_{j} \leq 1$ and $\left.\chi\right|_{K_{j-1}} \equiv 1$. We thus have maps

$$
\begin{aligned}
\mathcal{D}_{*}\left(K_{j+1}\right) & \rightarrow \mathcal{D}_{*}\left(K_{j}\right) \\
f & \mapsto \chi_{j} f
\end{aligned}
$$

by which

$$
\mathcal{E}_{*}(\Omega)=\underset{j \rightarrow \infty}{\operatorname{proj} \lim } \mathcal{D}_{*}\left(K_{j}\right)
$$

Lemma 2.34. Let $K$ be a compact subset of an open set $\Omega \subset \mathbb{R}^{N}$. Then $\mathcal{D}_{*}(K)$ carries the topology which is induced by $\mathcal{E}_{*}(\Omega)$.

Proposition 2.35. The following properties hold:
(1) The inclusion $\mathcal{D}_{*}(\Omega) \hookrightarrow \mathcal{E}_{*}(\Omega)$ is continuous and has dense image.
(2) Let $\omega, \sigma \in \mathcal{W}$ with $\sigma=o(\omega)$, then the inclusion $\mathcal{E}_{\{\omega\}}(\Omega) \hookrightarrow \mathcal{E}_{(\sigma)}(\Omega)$ is continuous and has dense image.

Proposition 2.36. Let $\Omega \subset \mathbb{R}^{N}$ be open and let $\left\{\Omega_{j}\right\}_{j \in \mathbb{N}}$ be an open covering of $\Omega$. Then there are $f_{j} \in \mathcal{D}_{*}\left(\Omega_{j}\right)$ with $0 \leq f_{j} \leq 1$ such that $\sum_{j=1}^{\infty} f_{j}=1$ and $\left\{\operatorname{supp} f_{j}\right\}_{j \in \mathbb{N}}$ is locally finite.

Proposition 2.37. Let $\Omega_{1}, \Omega_{2}$ be given open subsets of $\mathbb{R}^{N}$, let $g: \Omega_{1} \rightarrow \Omega_{2}$ be real-analytic, and let $f \in \mathcal{E}_{*}\left(\Omega_{2}\right)$. Then $f \circ g \in \mathcal{E}_{*}\left(\Omega_{1}\right)$. In particular, $\mathcal{E}_{*}(\Omega)$ contains all real-analytic functions on $\Omega$.

Let us now introduce the $\omega$-ultradistributions of Beurling and of Roumieu type with compact and arbitrary support, taking $\omega \in \mathcal{W}$ in the Roumieu case and $\omega \in \mathcal{W}^{\prime}$ in the Beurling case.

Definition 2.38. Let $\omega \in \mathcal{W}$ and $\Omega \subset \mathbb{R}^{N}$ an open set.
(1) The elements of $\mathcal{D}_{\{\omega\}}^{\prime}(\Omega)$ are called $\omega$-ultradistributions of Roumieu type.
(2) For an ultradistribution $T \in \mathcal{D}_{\{\omega\}}^{\prime}(\Omega)$ its support $\operatorname{supp} T$ is the set of all points such that for every neighbourhood $U$ there is $\varphi \in \mathcal{D}_{\{\omega\}}(U)$ with $<T, \varphi>\neq 0$.

Definition 2.39. Let $\omega \in \mathcal{W}^{\prime}$ and $\Omega \subset \mathbb{R}^{N}$ an open set.
(1) The elements of $\mathcal{D}_{(\omega)}^{\prime}(\Omega)$ are called $\omega$-ultradistributions of Beurling type.
(2) For an ultradistribution $T \in \mathcal{D}_{(\omega)}^{\prime}(\Omega)$ its support $\operatorname{supp} T$ is the set of all points such that for every neighbourhood $U$ there is $\varphi \in \mathcal{D}_{(\omega)}(U)$ with $<T, \varphi>\neq 0$.

Remark 2.40. By Proposition 2.28, the definition of support of an ultradistribution $T$ doesn't depend on the choice of the class $\mathcal{D}_{\{\omega\}}(\Omega)$ for $\omega \in \mathcal{W}$ (resp. $\mathcal{D}_{(\omega)}(\Omega)$ for $\left.\omega \in \mathcal{W}^{\prime}\right)$ as long as it contains $T$. In particular, if $T$ is a distribution $T \in \mathcal{D}^{\prime}(\Omega)$, then the support defined above is the usual one.

As in BMT, Prop. 5.3], the elements of $\mathcal{E}_{*}^{\prime}(\Omega)$ can be identified with distributions in $\mathcal{D}_{*}^{\prime}(\Omega)$ with compact support:

Proposition 2.41. An ultradistribution $T \in \mathcal{D}_{*}^{\prime}(\Omega)$ can be extended continuously to $\mathcal{E}_{*}(\Omega)$ iff $\operatorname{supp} T$ is a compact subset of $\Omega$.

Definition 2.42. Let $\Omega \subset \mathbb{R}^{N}$ be open. For $f \in \mathcal{E}_{*}(\Omega)$ and $T \in \mathcal{D}_{*}^{\prime}(\Omega)$ we define $f T \in \mathcal{D}_{*}^{\prime}(\Omega)$ by

$$
\langle f T, \varphi\rangle=\langle T, f \varphi\rangle \quad \forall \varphi \in \mathcal{D}_{*}(\Omega)
$$

This makes $\mathcal{D}_{*}^{\prime}(\Omega)$ an $\mathcal{E}_{*}(\Omega)$-module.
Definition 2.43. For an ultradistribution $\mu \in \mathcal{E}_{*}^{\prime}\left(\mathbb{R}^{N}\right)$, and for $f \in \mathcal{E}_{*}\left(\mathbb{R}^{N}\right)$ we define the convolution

$$
T_{\mu}(f):=\mu * f: \mathbb{R}^{N} \rightarrow \mathbb{C}
$$

by

$$
\mu * f(x)=\left\langle\mu_{y}, f(x-y)\right\rangle
$$

As in BMT, Prop. 6.3]:
Proposition 2.44. The convolution map

$$
T_{\mu}: \mathcal{E}_{*}\left(\mathbb{R}^{N}\right) \rightarrow \mathcal{E}_{*}\left(\mathbb{R}^{N}\right)
$$

is continuous.
Notation. For $z \in \mathbb{C}^{N}$ we set

$$
f_{z}(x)=e^{-i\langle x, z\rangle}, \quad x \in \mathbb{R}^{N}
$$

For each $\lambda>0$ we have

$$
\begin{align*}
\sup _{\alpha \in \mathbb{N}_{0}^{N}} \sup _{x \in \mathbb{R}^{N}}\left|f_{z}^{(\alpha)}(x)\right| e^{-\lambda \varphi^{*}\left(\frac{|\alpha|}{\lambda}\right)} & =\sup _{\alpha \in \mathbb{N}_{o}^{N}} \sup _{x \in \mathbb{R}^{N}}\left|z^{\alpha} \|\left|e^{-i\langle x, z\rangle}\right| e^{-\lambda \varphi^{*}\left(\frac{|\alpha|}{\lambda}\right)}\right. \\
& \leq \sup _{x \in \mathbb{R}^{N}} e^{\langle x, \operatorname{Im} z\rangle} \cdot \exp \left\{\sup _{\alpha \in \mathbb{N}_{0}^{N}}\left(|\alpha| \log |z|-\lambda \varphi^{*}\left(\frac{|\alpha|}{\lambda}\right)\right)\right\} \\
& =e^{H_{K}(\operatorname{Im} z)} \exp \left\{\sup _{\alpha \in \mathbb{N}_{0}^{N}} \lambda\left(\frac{|\alpha|}{\lambda} \log |z|-\varphi^{*}\left(\frac{|\alpha|}{\lambda}\right)\right)\right\} \\
& =e^{H_{K}(\operatorname{Im} z)} \exp \left\{\lambda \varphi^{* *}(\log |z|)\right\} \\
& =e^{H_{K}(\operatorname{Im} z)+\lambda \omega(z)} \tag{2.13}
\end{align*}
$$

Thus $f_{z} \in \mathcal{E}_{*}(\Omega)$ for all $\omega$ and $\Omega$.
Definition 2.45. The Fourier-Laplace transform $\hat{\mu}$ of $\mu \in \mathcal{E}_{*}^{\prime}(\Omega)$ is defined by

$$
\hat{\mu}: z \mapsto\left\langle\mu, f_{z}\right\rangle
$$

Note that for $\varphi \in \mathcal{D}_{*}(\Omega)$ :

$$
\begin{aligned}
\widehat{\mu * \varphi}(z) & =\int_{\mathbb{R}^{N}} \mu * \varphi(t) f_{z}(t) d t=\int_{\mathbb{R}^{N}}\left\langle\mu_{y}, f_{z}(t) \varphi(t-y)\right\rangle d t \\
& =\int_{\mathbb{R}^{N}}\left\langle\mu_{y}, f_{z}(s+y) \varphi(s)\right\rangle d s=\int_{\mathbb{R}^{N}}\left\langle\mu, f_{z}\right\rangle \varphi(s) f_{z}(s) d s \\
& =\left\langle\mu, f_{z}\right\rangle \int_{\mathbb{R}^{N}} \varphi(s) f_{z}(s) d s=\hat{\mu}(z) \hat{\varphi}(z)
\end{aligned}
$$

Theorem 2.46 (Paley-Wiener theorem for $\omega$-ultradistributions of Beurling type). Let $\omega \in \mathcal{W}^{\prime}$ and $K \subset \mathbb{R}^{N}$ compact and convex. If $\mu \in \mathcal{E}_{(\omega)}^{\prime}\left(\mathbb{R}^{N}\right)$ with $\operatorname{supp} \mu \subset K$ then $\hat{\mu}$ is entire and there exist $C, \lambda>0$ such that

$$
\begin{equation*}
|\hat{\mu}(z)| \leq C e^{H_{K}(\operatorname{Im} z)+\lambda \omega(z)} \quad \forall z \in \mathbb{C}^{N} \tag{2.14}
\end{equation*}
$$

This holds, in particular, for $K$ equal to the convex hull of $\operatorname{supp} \mu$. Moreover,

$$
\begin{equation*}
\langle\mu, \varphi\rangle=\frac{1}{(2 \pi)^{N}} \int_{\mathbb{R}^{N}} \hat{\mu}(-t) \hat{\varphi}(t) d t \quad \forall \varphi \in \mathcal{D}_{(\omega)}\left(\mathbb{R}^{N}\right) \tag{2.15}
\end{equation*}
$$

Conversely, if $g$ is an entire function on $\mathbb{C}^{N}$ that satisfies 2.14), i.e.

$$
|g(z)| \leq C e^{H_{K}(\operatorname{Im} z)+\lambda \omega(z)} \quad \forall z \in \mathbb{C}^{N}
$$

for some $C, \lambda>0$, then there exists $\mu \in \mathcal{E}_{(\omega)}^{\prime}\left(\mathbb{R}^{N}\right)$ such that $\hat{\mu}=g$ and $\operatorname{supp} \mu \subset K$.
Proof. Let us first prove that if $f \in \mathcal{E}_{(\omega)}\left(\mathbb{R}^{N}\right)$ with $\left.f\right|_{K} \equiv 0$ then $\langle\mu, f\rangle=0$.
To this aim we assume, without loss of generality, that $0 \in \stackrel{\circ}{K}$ and define

$$
f_{t}(x):=f(t x), \quad 0<t<1
$$

Then $\left\langle\mu, f_{t}\right\rangle=0$. Let us to prove that

$$
\begin{equation*}
\lim _{t \rightarrow 1^{-}}\left\langle\mu, f_{t}\right\rangle=\langle\mu, f\rangle \tag{2.16}
\end{equation*}
$$

We have that $\mu \in \mathcal{E}_{(\omega)}^{\prime}\left(\mathbb{R}^{N}\right)$, so $\mu$ is a linear and continuous function on $\mathcal{E}_{(\omega)}\left(\mathbb{R}^{N}\right)$ and to prove (2.16) it's sufficient to prove that $f_{t} \rightarrow f$ in $\mathcal{E}_{(\omega)}\left(\mathbb{R}^{N}\right)$. Therefore, fix $\tilde{K} \subset \mathbb{R}^{N}$ compact, $m \in \mathbb{N}$ and prove that

$$
\begin{equation*}
\sup _{\alpha \in \mathbb{N}_{0}^{N}} \sup _{x \in \tilde{K}}\left|D^{\alpha} f_{t}(x)-D^{\alpha} f(x)\right| e^{-m \varphi^{*}\left(\frac{|\alpha|}{m}\right)} \rightarrow 0 \tag{2.17}
\end{equation*}
$$

Indeed,

$$
\begin{aligned}
\left|D^{\alpha} f_{t}(x)-D^{\alpha} f(x)\right| & =\left|D^{\alpha} f(t x)-D^{\alpha} f(x)\right|=\left|t^{\alpha}\left(D^{\alpha} f\right)(t x)-D^{\alpha} f(x)\right| \\
& \leq\left|t^{\alpha}\left(D^{\alpha} f\right)(t x)-t^{\alpha} D^{\alpha} f(x)\right|+\left|t^{\alpha} D^{\alpha} f(x)-D^{\alpha} f(x)\right| \\
& =t^{\alpha}\left|\left(D^{\alpha} f\right)(t x)-D^{\alpha} f(x)\right|+\left(1-t^{\alpha}\right)\left|D^{\alpha} f(x)\right|
\end{aligned}
$$

so, for $0<t<1$, we have that

$$
\begin{align*}
\sup _{\alpha \in \mathbb{N}_{0}^{N}} \sup _{x \in \tilde{K}}\left|D^{\alpha} f_{t}(x)-D^{\alpha} f(x)\right| e^{-m \varphi^{*}\left(\frac{|\alpha|}{m}\right)} & \leq \sup _{\alpha \in \mathbb{N}_{0}^{N}} \sup _{x \in \tilde{K}}\left|\left(D^{\alpha} f\right)(t x)-D^{\alpha} f(x)\right| e^{-m \varphi^{*}\left(\frac{|\alpha|}{m}\right)}+  \tag{2.18}\\
& +\left(1-t^{\alpha}\right) \sup _{\alpha \in \mathbb{N}_{0}^{N}} \sup _{x \in \tilde{K}}\left|D^{\alpha} f(x)\right| e^{-m \varphi^{*}\left(\frac{|\alpha|}{m}\right)} .
\end{align*}
$$

We observe that $\left(1-t^{\alpha}\right) \rightarrow 0$ for $t \rightarrow 1^{-}$and $\sup _{\alpha \in \mathbb{N}_{0}^{N}} \sup _{x \in \tilde{K}}\left|D^{\alpha} f(x)\right| e^{-m \varphi^{*}\left(\frac{|\alpha|}{m}\right)}=C_{\tilde{K}}<\infty$ because $f \in \mathcal{E}_{(\omega)}\left(\mathbb{R}^{N}\right)$.
To estimate also the first addend of (2.18) let us remark that it's not restrictive to assume $0 \in \tilde{K}$, since we can enlarge $\tilde{K}$. Therefore, denoting by $\operatorname{ch}(\tilde{K})$ the convex hull of $\tilde{K}$, by the Lagrange Theorem we have that there exists $\xi \in \operatorname{ch}(\tilde{K})$ on the segment of extremes $x$ and $t x$, such that

$$
\begin{aligned}
& \sup _{\alpha \in \mathbb{N}_{0}^{N}} \sup _{x \in \tilde{K}}\left|\left(D^{\alpha} f\right)(t x)-D^{\alpha} f(x)\right| e^{-m \varphi^{*}\left(\frac{|\alpha|}{m}\right)}=\sup _{\alpha \in \mathbb{N}_{0}^{N}} \sup _{x \in \tilde{K}}\left|\left\langle\nabla\left(D^{\alpha} f\right)(\xi), t x-x\right\rangle\right| e^{-m \varphi^{*}\left(\frac{|\alpha|}{m}\right)} \\
& \leq \sup _{\alpha \in \mathbb{N}_{0}^{N}}\left\{\sup _{\xi \in \operatorname{ch}(\tilde{K})}\left\|\nabla D^{\alpha} f(\xi)\right\| \cdot(1-t) \cdot \sup _{x \in \tilde{K}}\|x\| \cdot e^{-m \varphi^{*}\left(\frac{|\alpha|}{m}\right)}\right\} \\
& \leq C(1-t) \sup _{\alpha \in \mathbb{N}_{0}^{N}} \sup _{\xi \in \operatorname{ch}(\tilde{K})}\left\|\nabla D^{\alpha} f(\xi)\right\| e^{-m \varphi^{*}\left(\frac{|\alpha|}{m}\right)}
\end{aligned}
$$

for some $C>0$.
However,

$$
\left\|\nabla D^{\alpha} f(\xi)\right\| \leq \sum_{j=1}^{N}\left|D_{j} D^{\alpha} f(\xi)\right| \leq \sum_{j=1}^{N} \sup _{|\beta|=1}\left|D^{\beta} D^{\alpha} f(\xi)\right|=N \sup _{|\beta|=1}\left|D^{\alpha+\beta} f(\xi)\right|
$$

so

$$
\sup _{\alpha \in \mathbb{N}_{0}^{N}} \sup _{x \in \tilde{K}}\left|\left(D^{\alpha} f\right)(t x)-D^{\alpha} f(x)\right| e^{-m \varphi^{*}\left(\frac{|\alpha|}{m}\right)} \leq C N(1-t) \sup _{\tilde{\alpha} \in \mathbb{N}^{N}} \sup _{\xi \in \operatorname{ch}(\tilde{K})}\left|D^{\tilde{\alpha}} f(\xi)\right| e^{-m \varphi^{*}\left(\frac{|\alpha|}{m}\right)}
$$

where $\sup _{\tilde{\alpha} \in \mathbb{N}^{N}} \sup _{\xi \in \operatorname{ch}(\tilde{K})}\left|D^{\tilde{\alpha}} f(\xi)\right| e^{-m \varphi^{*}\left(\frac{|\alpha|}{m}\right)}<\infty$ by definition of $f \in \mathcal{E}_{(\omega)}\left(\mathbb{R}^{N}\right)$. Then, from (2.18), we have obtained (2.17), i.e.

$$
f_{t} \rightarrow f \quad \text { in } \mathcal{E}_{(\omega)}\left(\mathbb{R}^{N}\right)
$$

Therefore (2.16) holds true.
Since $\left\langle\mu, f_{t}\right\rangle=0$ for all $t \in(0,1)$, then $\langle\mu, f\rangle=0$. This can be done for all $f \in \mathcal{E}_{(\omega)}\left(\mathbb{R}^{N}\right)$ with $\left.f\right|_{K}=0$, and hence there exists $C, \lambda>0$ such that

$$
\begin{equation*}
|\langle\mu, f\rangle| \leq C p_{K, \lambda}(f) \quad \forall f \in \mathcal{E}_{(\omega)}\left(\mathbb{R}^{N}\right) \tag{2.19}
\end{equation*}
$$

For $f_{z}(x)=e^{-i\langle x, z\rangle}$, we observe that

$$
p_{K, \lambda}\left(f_{z}\right)=\sup _{\alpha \in \mathbb{N}_{0}^{N}} \sup _{x \in \mathbb{R}^{N}}\left|f_{z}^{(\alpha)}(x)\right| e^{-\lambda \varphi^{*}\left(\frac{|\alpha|}{\lambda}\right)} \leq e^{H_{K}(\operatorname{Im} z)+\lambda \omega(z)}
$$

by (2.13).
Substituting in (2.19) with $f=f_{z}$ and remembering that $\hat{\mu}(z)=\left\langle\mu, f_{z}\right\rangle$, we obtain (2.14); moreover $\hat{\mu}$ is entire because $f_{z}$ is entire (cf. also BMT, Prop. 7.2]).

To prove (2.15) we observe that if $\varphi \in \mathcal{D}_{(\omega)}\left(\mathbb{R}^{N}\right)$, then

$$
\begin{align*}
\langle\mu, \varphi\rangle & =\mu * \check{\varphi}(0)=\mathcal{F}^{-1}(\widehat{\mu * \stackrel{\varphi}{\varphi}})(0) \\
& =\mathcal{F}^{-1}(\hat{\mu} \cdot \hat{\varphi})(0) \\
& =\frac{1}{(2 \pi)^{N}} \int_{\mathbb{R}^{N}} \hat{\mu}(t) \hat{\varphi}(-t) d t \\
& =\frac{1}{(2 \pi)^{N}} \int_{\mathbb{R}^{N}} \hat{\mu}(-t) \hat{\varphi}(t) d t
\end{align*}
$$

$\square$

For $\omega \in \mathcal{W}^{\prime}$ we denote by $\mathcal{I}^{(\omega)}\left(K_{2}, \Omega\right)$ the subspace of functions in $\mathcal{E}_{(\omega)}(\Omega)$ which vanish of infinite order on $K_{2}$ :

$$
\mathcal{I}^{(\omega)}\left(K_{2}, \Omega\right)=\left\{f \in \mathcal{E}_{(\omega)}(\Omega): D^{\alpha} f \equiv 0 \text { on } K_{2}, \forall \alpha \in \mathbb{N}_{0}^{N}\right\}
$$

Definition 3.1. Let $\omega \in \mathcal{W}^{\prime}$. We define the space $W_{K_{2}}^{(\omega)}$ of Whitney $\omega$-ultradifferentiable functions on $K_{2}$ by the exact sequence

$$
0 \longrightarrow \mathcal{I}^{(\omega)}\left(K_{2}, \Omega\right) \longrightarrow \mathcal{E}_{(\omega)}(\Omega) \longrightarrow W_{K_{2}}^{(\omega)} \longrightarrow 0
$$

i.e.

$$
W_{K_{2}}^{(\omega)} \simeq \mathcal{E}_{(\omega)}(\Omega) / \mathcal{I}^{(\omega)}\left(K_{2}, \Omega\right)
$$

In the same way we define $W_{K_{1}}^{(\omega)}$, the space of Whitney $\omega$-ultradifferentiable functions on $K_{1}$.
Denoting by $\mathcal{P}=\mathbb{C}\left[\zeta_{1}, \ldots, \zeta_{N}\right]$ the ring of complex polynomials in $N$ indeterminates, we consider $W_{K_{2}}^{(\omega)}$ as a unitary left and right $\mathcal{P}-$ module by the action of $p(\zeta)$ on $u \in W_{K_{2}}^{(\omega)}$ described by

$$
p(\zeta) u=u p(\zeta)=p(D) u
$$

by the formal substitution $\zeta_{j} \leftrightarrow \frac{1}{i} \partial_{j}$.
Given an $a_{1} \times a_{0}$ matrix $A_{0}(D)$ with polynomial entries, we can thus consider the corresponding operator $A_{0}(D)$. We want to solve, in the Whitney's sense, the Cauchy problem

$$
\left\{\begin{array}{l}
A_{0}(D) u=f  \tag{3.1}\\
\left.u\right|_{K_{1}} \equiv 0
\end{array}\right.
$$

where $\left.u\right|_{K_{1}} \equiv 0$ means that $u$ vanishes with all its derivatives on $K_{1}$.
Let us remark that if ${ }^{t} Q(\zeta): \mathcal{P}^{a_{1}} \rightarrow \mathcal{P}$ is such that

$$
\begin{equation*}
{ }^{t} A_{0}(\zeta)^{t} Q(\zeta) \equiv 0 \tag{3.2}
\end{equation*}
$$

then, in order to solve the Cauchy problem (3.1), $f$ must satisfy the integrability condition

$$
\begin{equation*}
Q(D) f=0 \tag{3.3}
\end{equation*}
$$

because of $Q(D) f=Q(D) A_{0}(D) u=0$.
Since $\mathcal{P}$ is a Noetherian ring, the collection of all vectors ${ }^{t} Q(\zeta)$ satisfying (3.2) form a finitely generated $\mathcal{P}$-module. So we can insert the map ${ }^{t} A_{0}(\zeta): \mathcal{P}^{a_{1}} \rightarrow \mathcal{P}^{a_{0}}$ into a Hilbert resolution:

$$
0 \longrightarrow \mathcal{P}^{a_{d}} \xrightarrow{{ }^{t} A_{d-1}(\zeta)} \mathcal{P}^{a_{d-1}} \longrightarrow \ldots \longrightarrow \mathcal{P}^{a_{2}} \xrightarrow{{ }^{t} A_{1}(\zeta)} \mathcal{P}^{a_{1}} \xrightarrow{{ }^{t} A_{0}(\zeta)} \mathcal{P}^{a_{0}} \longrightarrow \mathcal{M} \longrightarrow 0
$$

where $\mathcal{M}=$ coker ${ }^{t} A_{0}(\zeta)=\mathcal{P}^{a_{0}} /{ }^{t} A_{0}(\zeta) \mathcal{P}^{a_{1}}$ and the matrix ${ }^{t} A_{1}(\zeta)$ is obtained from a basis of the integrability conditions (3.2). The sequence is exact, i.e. $\operatorname{Im}^{t} A_{j}=\operatorname{Ker}^{t} A_{j+1}$.

Therefore a necessary condition to solve (3.1), is that $f$ satisfies the following integrability condition:

$$
\begin{equation*}
A_{1}(D) f=0 \tag{3.4}
\end{equation*}
$$

Moreover, every necessary condition for the solvability of (3.1), which can be expressed in terms of linear partial differential equations, is a consequence of (3.4) (cf. [N2]).

Definition 3.2. If $A_{1}(\zeta) \not \equiv 0$ then the Cauchy problem (3.1) is called overdetermined and, to solve it, the condition (3.4) has to be satisfied.

Let us remark that if $u$ solves (3.1), then also $f$ must vanish with all its derivatives on $K_{1}$, so that we look for solutions $u \in\left(W_{K_{2}}^{(\omega)}\right)^{a_{0}}$ of (3.1) when $f$ satisfies

$$
\left\{\begin{array}{l}
f \in\left(W_{K_{2}}^{(\omega)}\right)^{a_{1}}  \tag{3.5}\\
A_{1}(D) f=0 \\
\left.f\right|_{K_{1}} \equiv 0
\end{array}\right.
$$

Remark 3.3. By Whitney's extension theorem it's not restrictive to consider zero Cauchy data (see [B], BBMT, MT, M].

Let us denote by $\mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)$ the space of Whitney $\omega$-ultradifferentiable fuctions on $K_{2}$ which vanish of infinite order on $K_{1}$ :

$$
\mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)=\left\{f \in W_{K_{2}}^{(\omega)}:\left.D^{\alpha} f\right|_{K_{1}} \equiv 0 \forall \alpha \in \mathbb{N}_{0}^{N}\right\}
$$

The Cauchy problem (3.1)-(3.5) is then equivalent to:

$$
\left\{\begin{array}{l}
\text { given } f \in\left(\mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)\right)^{a_{1}} \text { such that } A_{1}(D) f=0  \tag{3.6}\\
\text { find } u \in\left(\mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)\right)^{a_{0}} \text { such that } A_{0}(D) u=f
\end{array}\right.
$$

Remark 3.4. By the isomorphisms

$$
\begin{aligned}
\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{M}, \mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)\right) & \simeq \operatorname{Ker} A_{0}(D)=\left\{u \in \mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)^{a_{0}}: A_{0}(D) u=0\right\} \\
\operatorname{Ext}_{\mathcal{P}}^{1}\left(\mathcal{M}, \mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)\right) & \simeq \frac{\operatorname{Ker} A_{1}(D)}{\operatorname{Im} A_{0}(D)}
\end{aligned}
$$

we have:
(1) uniqueness of solutions of the Cauchy problem (3.6) is equivalent to the condition

$$
\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{M}, \mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)\right)=0
$$

(2) existence of solutions of (3.6), is equivalent to the condition

$$
\operatorname{Ext}_{\mathcal{P}}^{1}\left(\mathcal{M}, \mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)\right)=0
$$

(3) existence and uniqueness of a solution of (3.6), is equivalent to the condition

$$
\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{M}, \mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)\right)=\operatorname{Ext}_{\mathcal{P}}^{1}\left(\mathcal{M}, \mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)\right)=0
$$

Remark 3.5. Remark 3.4 enlightens the algebraic invariance of the problem: uniqueness and/or existence of solutions of the Cauchy problem (3.6) depend only on the module $\mathcal{M}$ and not on it's presentation by a particular matrix ${ }^{t} A_{0}(D)$.

Note also that we have the short exact sequence

$$
0 \longrightarrow \mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right) \longrightarrow W_{K_{2}}^{(\omega)} \longrightarrow W_{K_{1}}^{(\omega)} \longrightarrow 0
$$

that implies the long exact sequence

$$
\begin{align*}
0 & \longrightarrow \operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{M}, \mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)\right) \longrightarrow \operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{M}, W_{K_{2}}^{(\omega)}\right) \longrightarrow \operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{M}, W_{K_{1}}^{(\omega)}\right) \longrightarrow \\
& \longrightarrow \operatorname{Ext}_{\mathcal{P}}^{1}\left(\mathcal{M}, \mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)\right) \longrightarrow \operatorname{Ext}_{\mathcal{P}}^{1}\left(\mathcal{M}, W_{K_{2}}^{(\omega)}\right) \longrightarrow \operatorname{Ext}_{\mathcal{P}}^{1}\left(\mathcal{M}, W_{K_{1}}^{(\omega)}\right) \longrightarrow \\
& \longrightarrow \operatorname{Ext}_{\mathcal{P}}^{2}\left(\mathcal{M}, \mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)\right) \longrightarrow \ldots \tag{3.7}
\end{align*}
$$

As in [N1] (cf. also [B, BN1, BN3]) we have that $W_{K_{i}}^{(\omega)}$, for $i=1,2$, are injective $\mathcal{P}-$ modules, i.e. the following holds:
Lemma 3.6. Let $\omega \in \mathcal{W}^{\prime}, \mathcal{M}$ a $\mathcal{P}$-module of finite type and $K$ a compact convex subset of $\mathbb{R}^{N}$. Then $\operatorname{Ext}_{\mathcal{P}}^{j}\left(\mathcal{M}, W_{K_{i}}^{(\omega)}\right)=0$ for $i=1,2$ and for all $j \geq 1$.

By Lemma 3.6, the complex (3.7) reduces to:

$$
\begin{aligned}
0 & \longrightarrow \operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{M}, \mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)\right) \longrightarrow \operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{M}, W_{K_{2}}^{(\omega)}\right) \longrightarrow \operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{M}, W_{K_{1}}^{(\omega)}\right) \longrightarrow \\
& \longrightarrow \operatorname{Ext}_{\mathcal{P}}^{1}\left(\mathcal{M}, \mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)\right) \longrightarrow 0 .
\end{aligned}
$$

In particular

$$
\begin{equation*}
\operatorname{Ext}_{\mathcal{P}}^{j}\left(\mathcal{M}, \mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)\right)=0 \quad \forall j>1 \tag{3.8}
\end{equation*}
$$

Remark 3.7. From Remark 3.4 and the above considerations, it follows that uniqueness and/or existence of solutions of the Cauchy problem (3.6) is related to injectivity and/or surjectivity of the homomorphism

$$
\begin{equation*}
\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{M}, W_{K_{2}}^{(\omega)}\right) \longrightarrow \operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{M}, W_{K_{1}}^{(\omega)}\right) \tag{3.9}
\end{equation*}
$$

The injectivity of (3.9) is equivalent to the fact that the dual homomorphism

$$
\begin{equation*}
\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{M}, W_{K_{1}}^{(\omega)}\right)^{\prime} \longrightarrow \operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{M}, W_{K_{2}}^{(\omega)}\right)^{\prime} \tag{3.10}
\end{equation*}
$$

has a dense image.
Moreover, surjectivity is equivalent to have a dense and closed image. But (3.9) has a closed image if and only if (3.10) has a closed image (cf. Gr, Ch. IV, $\S 2, \mathrm{n} .4$, Thm. 3), so that the surjectivity of (3.9) is equivalent to the fact that the dual homorphism (3.10) is injective and has a closed image.

By Remarks 3.4 and 3.7, and [N2, Prop. 1.1-1.2], we have that:
Proposition 3.8. Let $\omega \in \mathcal{W}^{\prime}$ and $K_{1}, K_{2}$ closed convex subsets of $\mathbb{R}^{N}$ with $K_{1} \subsetneq K_{2}, \overline{\stackrel{\circ}{K}_{j}}=K_{j}$ for $j=1,2$. Let $\mathcal{M}$ be a unitary $\mathcal{P}$-module of finite type and denote by $\operatorname{Ass}(\mathcal{M})$ the set of all prime ideals associated to $\mathcal{M}$.

Then the following statements are equivalent:
(1) The Cauchy problem (3.6) admits at most one solution;
(2) $\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{M}, \mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)\right)=0$;
(3) $\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, \mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)\right)=0$ for all $\wp \in \operatorname{Ass}(\mathcal{M})$;
(4) The homomorphisms

$$
\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K_{2}}^{(\omega)}\right) \rightarrow \operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K_{1}}^{(\omega)}\right)
$$

are injective for all $\wp \in \operatorname{Ass}(\mathcal{M})$;
(5) The homomorphisms

$$
\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K_{1}}^{(\omega)}\right)^{\prime} \rightarrow \operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K_{2}}^{(\omega)}\right)^{\prime}
$$

have a dense image for all $\wp \in \operatorname{Ass}(\mathcal{M})$.
Proposition 3.9. Let $\omega \in \mathcal{W}^{\prime}, \mathcal{M}$ a unitary $\mathcal{P}$-module of finite type and $K_{1}, K_{2}$ closed convex subsets of $\mathbb{R}^{N}$ with $K_{1} \subsetneq K_{2}, \overline{\circ_{j}}=K_{j}$ for $j=1$, 2. Then the following statements are equivalent:
(1) The Cauchy problem (3.6) admits at least a solution;
(2) $\operatorname{Ext}_{\mathcal{P}}^{1}\left(\mathcal{M}, \mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)\right)=0$;
(3) $\operatorname{Ext}_{\mathcal{P}}^{1}\left(\mathcal{P} / \wp, \mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)\right)=0$ for all $\wp \in \operatorname{Ass}(\mathcal{M})$;
(4) The homomorphisms

$$
\begin{equation*}
\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K_{2}}^{(\omega)}\right) \rightarrow \operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K_{1}}^{(\omega)}\right) \tag{3.11}
\end{equation*}
$$

are surjective for all $\wp \in \operatorname{Ass}(\mathcal{M})$;
(5) The homomorphisms

$$
\begin{equation*}
\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K_{1}}^{(\omega)}\right)^{\prime} \rightarrow \operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K_{2}}^{(\omega)}\right)^{\prime} \tag{3.12}
\end{equation*}
$$

are injective and have a closed image, for all $\wp \in \operatorname{Ass}(\mathcal{M})$.
Proposition 3.10. Let $\omega \in \mathcal{W}^{\prime}, \mathcal{M}$ a unitary $\mathcal{P}$-module of finite type and $K_{1}, K_{2}$ closed convex subsets of $\mathbb{R}^{N}$ with $K_{1} \subsetneq K_{2}, \overline{K_{j}}=K_{j}$ for $j=1,2$. Then the following statements are equivalent:
(1) The Cauchy problem (3.6) admists one and only one solution;
(2) $\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{M}, \mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)\right)=\operatorname{Ext}_{\mathcal{P}}^{1}\left(\mathcal{M}, \mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)\right)=0$;
(3) $\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, \mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)\right)=\operatorname{Ext}_{\mathcal{P}}^{1}\left(\mathcal{P} / \wp, \mathcal{I}^{(\omega)}\left(K_{1}, K_{2}\right)\right)=0$ for all $\wp \in \operatorname{Ass}(\mathcal{M})$;
(4) The homomorphisms

$$
\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K_{2}}^{(\omega)}\right) \rightarrow \operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K_{1}}^{(\omega)}\right)
$$

are isomorphisms for all $\wp \in \operatorname{Ass}(\mathcal{M})$;
(5) The homomorphisms

$$
\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K_{1}}^{(\omega)}\right)^{\prime} \rightarrow \operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K_{2}}^{(\omega)}\right)^{\prime}
$$

are isomorphisms for all $\wp \in \operatorname{Ass}(\mathcal{M})$.
The overdetermined Cauchy problem (3.6) is thus reduced to the study of the dual homomorphism

$$
\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K_{1}}^{(\omega)}\right)^{\prime} \rightarrow \operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K_{2}}^{(\omega)}\right)^{\prime}, \quad \wp \in \operatorname{Ass}(\mathcal{M})
$$

Let us start with some preliminary results.
Lemma 3.11. Let $\omega \in \mathcal{W}^{\prime}$ and $K$ a convex and closed subset of $\mathbb{R}^{N}$, with $\bar{K}=K$. Then

$$
\left(W_{K}^{(\omega)}\right)^{\prime} \simeq \mathcal{E}_{(\omega)}^{\prime}(K)
$$

Proof. If $K$ is compact with $\stackrel{\circ}{K} \neq \emptyset$ and $0 \in \stackrel{\circ}{K}$, then by [BBMT, Cor. 4.7] and [MT, Prop. 3.6] we have that $\mu \in\left(W_{K}^{(\omega)}\right)^{\prime}$ if and only if there exist $\lambda, C>0$ such that

$$
\begin{equation*}
|\hat{\mu}(\zeta)| \leq C e^{\left(H_{K}(\operatorname{Im} \zeta)+\lambda \omega(\zeta)\right)} \quad \forall \zeta \in \mathbb{C}^{N} \tag{3.13}
\end{equation*}
$$

By the Paley-Wiener Theorem 2.46 this is equivalent to

$$
\mu \in \mathcal{E}_{(\omega)}^{\prime}(K)
$$

Therefore the lemma is proved (cf. also [M, N1]).
Lemma 3.12. Let $\omega \in \mathcal{W}^{\prime}$, $\wp ~ a ~ p r i m e ~ i d e a l ~ o f ~ \mathcal{P ~ a n d ~} K \subset \mathbb{R}^{N}$ a convex and closed set with $\bar{K}=K$. Then we have the following isomorphism:

$$
\begin{equation*}
\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K}^{(\omega)}\right)^{\prime} \simeq \mathcal{E}_{(\omega)}^{\prime}(K) / \wp(D) \otimes \mathcal{E}_{(\omega)}^{\prime}(K) \tag{3.14}
\end{equation*}
$$

with

$$
\wp(D) \otimes \mathcal{E}_{(\omega)}^{\prime}(K):=\left\{\sum_{h=1}^{r} p_{h}(D) T_{h}: T_{h} \in \mathcal{E}_{(\omega)}^{\prime}(K)\right\},
$$

where $p_{1}(\zeta), \ldots, p_{r}(\zeta)$ are generators of $\wp$.
Proof. For any closed subspace $F$ of a Fréchet space $E$, the dual $F^{\prime}$ of $F$ is isomorphic (cf. MV, Prop. 6.14]) to:

$$
F^{\prime} \simeq E^{\prime} / F^{0}
$$

where $F^{0}$ is the annihilator of $F$, defined by

$$
F^{0}:=\left\{T \in E^{\prime}: T(f)=0, \forall f \in F\right\}
$$

Then, since $\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K}^{(\omega)}\right)$ is a closed subspace of the Fréchet space $W_{K}^{(\omega)}$, we have

$$
\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K}^{(\omega)}\right)^{\prime} \simeq\left(W_{K}^{(\omega)}\right)^{\prime} /\left(\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K}^{(\omega)}\right)\right)^{0}
$$

and, by Lemma 3.11,

$$
\begin{equation*}
\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K}^{(\omega)}\right)^{\prime} \simeq \mathcal{E}_{(\omega)}^{\prime}(K) /\left(\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K}^{(\omega)}\right)\right)^{0} \tag{3.15}
\end{equation*}
$$

with

$$
\left(\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K}^{(\omega)}\right)\right)^{0}=\left\{T \in \mathcal{E}_{(\omega)}^{\prime}(K): T(u)=0, \quad \forall u \in \operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K}^{(\omega)}\right)\right\}
$$

Observe that, for $V(\wp)$ defined as in (1.3), we have

$$
V=V(\wp)=\left\{\zeta \in \mathbb{C}^{N}: p_{h}(-\zeta)=0, \forall h=1, \ldots, r\right\}
$$

and

$$
p_{h}\left(D_{x}\right) e^{-i<x, \zeta>}=p_{h}(-\zeta) e^{-i<x, \zeta>}=0 \quad \forall \zeta \in V(\wp) .
$$

But

$$
\begin{aligned}
\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K}^{(\omega)}\right) & =\operatorname{Ker} A_{0}(D) \\
& =\left\{u \in W_{K}^{(\omega)}: p_{h}(D) u=0 \quad \forall h=1, \ldots, r\right\},
\end{aligned}
$$

so that

$$
\begin{equation*}
e^{-i<\cdot, \zeta>} \in \operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K}^{(\omega)}\right) \Leftrightarrow \zeta \in V(\wp) . \tag{3.16}
\end{equation*}
$$

Therefore the Fourier-Laplace transform $\hat{T}(\zeta)$ of an element $T \in\left(\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K}^{(\omega)}\right)\right)^{0}$ is an entire function which satisfies:

$$
\hat{T}(\zeta)=\left\langle T, e^{-i<\cdot, \zeta>}\right\rangle=0 \quad \forall \zeta \in V(\wp) .
$$

By the Nullstellensatz (see T]), there exist entire functions $F_{1}(\zeta), \ldots, F_{r}(\zeta)$ such that

$$
\hat{T}(\zeta)=\sum_{h=1}^{r} p_{h}(-\zeta) F_{h}(\zeta) \quad \forall \zeta \in \mathbb{C}^{N}
$$

By the Paley-Wiener Theorem 2.46, the Fourier-Laplace transform of a distribution $T \in \mathcal{E}_{(\omega)}^{\prime}(K)$ is characterized by an estimate of the form

$$
\begin{equation*}
|\hat{T}(\zeta)| \leq C e^{H_{\sigma_{T}}(\operatorname{Im} \zeta)+\alpha \omega(\zeta)} \tag{3.17}
\end{equation*}
$$

for some $C>0, \alpha \in \mathbb{N}$, where $\sigma_{T} \subset K$ is the convex hull of supp $T$.
If $K$ is not compact, we choose $K_{\alpha} \subset \stackrel{\circ}{K}_{\alpha+1}$ compact and such that $K=\cup_{\alpha} K_{\alpha}$, while if $K$ is compact, we choose $K_{\alpha}=K$ for all $\alpha$.

Since $\sigma_{T} \subset K_{\alpha}$ for some $\alpha$, then (3.17) implies that there exist $C>0, \alpha \in \mathbb{N}$ such that

$$
\begin{equation*}
|\hat{T}(\zeta)| \leq C e^{H_{K_{\alpha}}(\operatorname{Im} \zeta)+\alpha \omega(\zeta)} \tag{3.18}
\end{equation*}
$$

Define

$$
\psi_{\alpha}(\zeta):=H_{K_{\alpha}}(\operatorname{Im} \zeta)+\alpha \omega(\zeta)
$$

since $\omega$ is plurisubharmonic by condition $(\delta)$, then $\psi_{\alpha}(\zeta)$ is plurisubharmonic in $\mathbb{C}^{N}$.
Moreover we have that for every $k_{0}>0$ there exists $k_{1}>0$ such that

$$
\begin{equation*}
\left|\psi_{\alpha}(\operatorname{Im} z+\operatorname{Im} \zeta)-\psi_{\alpha}(\operatorname{Im} \zeta)\right| \leq k_{1} \quad \text { for }|z| \leq k_{0} \tag{3.19}
\end{equation*}
$$

Indeed,

$$
\begin{aligned}
\left|\psi_{\alpha}(z+\zeta)-\psi_{\alpha}(\zeta)\right| & =\left|H_{K}(\operatorname{Im} z+\operatorname{Im} \zeta)+\alpha \omega(z+\zeta)-H_{K}(\operatorname{Im} \zeta)-\alpha \omega(\zeta)\right| \\
& \leq\left|H_{K}(\operatorname{Im} z+\operatorname{Im} \zeta)-H_{K}(\operatorname{Im} \zeta)\right|+\alpha|\omega(z+\zeta)-\omega(\zeta)|
\end{aligned}
$$

Now observe that

$$
H_{K}(\operatorname{Im} z+\operatorname{Im} \zeta)-H_{K}(\operatorname{Im} \zeta) \leq H_{K}(\operatorname{Im} z)+H_{K}(\operatorname{Im} \zeta)-H_{K}(\operatorname{Im} \zeta) \leq c \quad|z| \leq k_{0}
$$

for some $c>0$ and

$$
\begin{equation*}
H_{K}(\operatorname{Im} \zeta)-H_{K}(\operatorname{Im} z+\operatorname{Im} \zeta) \leq H_{K}(\operatorname{Im} \zeta)-\langle x, \operatorname{Im} z\rangle-\langle x, \operatorname{Im} \zeta\rangle \quad \forall x \in K \tag{3.20}
\end{equation*}
$$

Moreover, by definition of supremum, for all $\varepsilon>0$ there exists $\bar{x} \in K$ such that

$$
\langle\bar{x}, \operatorname{Im} \zeta\rangle>H_{K}(\operatorname{Im} \zeta)-\varepsilon
$$

So, choosing such $\bar{x}$ in (3.20) we have

$$
H_{K}(\operatorname{Im} \zeta)-H_{K}(\operatorname{Im} z+\operatorname{Im} \zeta) \leq \varepsilon+c^{\prime}, \quad \text { if }|z| \leq k_{0}
$$

for some $c^{\prime}>0$, hence there exists $k_{1}>0$ such that

$$
\left|H_{K}(\operatorname{Im} z+\operatorname{Im} \zeta)-H_{K}(\operatorname{Im} \zeta)\right| \leq k_{1}, \quad|z| \leq k_{0}
$$

Furthermore, by Lemma 2.5 we have that

$$
\omega(z+\zeta) \leq K(1+\omega(z)+\omega(\zeta))
$$

for some $K>0$ and hence for every $k_{0}>0$ there exists $k_{1}^{\prime}>0$ such that

$$
|\omega(z+\zeta)-\omega(\zeta)| \leq k_{1}^{\prime}, \quad|z| \leq k_{0}
$$

Therefore (3.19) is proved.
We can therefore apply the Ehrenpreis Fundamental Theorem (see [H, Thm. 7.7.13], and [B, G] for more details) and obtain that we can choose the entire functions $F_{h}$ satisfying

$$
\left|F_{h}(\zeta)\right| \leq C^{\prime} e^{H_{K_{\alpha}}(\operatorname{Im} \zeta)+\alpha \omega(\zeta)+m^{\prime} \log (1+|\zeta|)}
$$

for some $C^{\prime}>0, m^{\prime} \in \mathbb{N}$.
By condition $(\gamma)^{\prime}$

$$
m^{\prime} \log (1+|\zeta|) \leq \frac{m^{\prime}}{b} \omega(\zeta)-\frac{m^{\prime} a}{b}
$$

so there exist $C^{\prime \prime}, C^{\prime \prime \prime}>0$ and $\alpha^{\prime} \in \mathbb{N}$ such that

$$
\left|F_{h}(\zeta)\right| \leq C^{\prime \prime} e^{H_{K_{\alpha}}(\operatorname{Im} \zeta)+\alpha^{\prime} \omega(\zeta)} \leq C^{\prime \prime \prime} e^{H_{K_{\alpha^{\prime \prime}}}(\operatorname{Im} \zeta)+\alpha^{\prime \prime} \omega(\zeta)}
$$

with $\alpha^{\prime \prime}=\max \left\{\alpha, \alpha^{\prime}\right\}$.
Hence, by the Paley-Wiener Theorem 2.46

$$
F_{h}=\widehat{T_{h}}
$$

for some $T_{h} \in \mathcal{E}_{(\omega)}^{\prime}(K)$.

We have thus proved that if $T \in\left(\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K}^{(\omega)}\right)\right)^{0}$, then

$$
\hat{T}(\zeta)=\sum_{h=1}^{r} p_{h}(-\zeta) \widehat{T_{h}}(\zeta)=\sum_{h=1}^{r} p_{h} \widehat{(D) T_{h}}(\zeta), \quad \text { with } \quad T_{h} \in \mathcal{E}_{(\omega)}^{\prime}(K)
$$

This result implies that

$$
T \in \wp(D) \otimes \mathcal{E}_{(\omega)}^{\prime}(K)
$$

and so, by (3.15),

$$
\left(\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K}^{(\omega)}\right)\right)^{\prime} \simeq \mathcal{E}_{(\omega)}^{\prime}(K) / \wp(D) \otimes \mathcal{E}_{(\omega)}^{\prime}(K)
$$

Let us define $\mathcal{O}_{\psi_{\alpha}}\left(\mathbb{C}^{N}\right)$ as the space of holomorphic functions $u$ on $\mathbb{C}^{N}$ which satisfy for some $C>0$ and for all $\zeta \in \mathbb{C}^{N}$ :

$$
\begin{equation*}
|u(\zeta)| \leq C e^{\psi_{\alpha}(\zeta)}=C e^{H_{K_{\alpha}}(\operatorname{Im} \zeta)+\alpha \omega(\zeta)} \tag{3.21}
\end{equation*}
$$

We can then consider the inductive limit

$$
\mathcal{O}_{\psi}\left(\mathbb{C}^{N}\right):=\underset{\alpha \rightarrow \infty}{\operatorname{ind} \lim _{\alpha}} \mathcal{O}_{\psi_{\alpha}}\left(\mathbb{C}^{N}\right)
$$

From the Paley-Wiener Theorem 2.46, by Fourier-Laplace transform we have the following isomorphism:

$$
\mathcal{E}_{(\omega)}^{\prime}(K) \simeq \mathcal{O}_{\psi}\left(\mathbb{C}^{N}\right)
$$

Therefore, from Lemma 3.12,

$$
\begin{equation*}
\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K}^{(\omega)}\right)^{\prime} \simeq \mathcal{O}_{\psi}\left(\mathbb{C}^{N}\right) / \wp(D) \otimes \mathcal{O}_{\psi}\left(\mathbb{C}^{N}\right) \tag{3.22}
\end{equation*}
$$

Let $V$ be a reduced affine algebraic variety. Denote by $\mathcal{O}_{\psi_{\alpha}}(V)$ the space of holomorphic functions on $V$ (i.e. complex valued continuous functions on $V$ which are restrictions of entire functions on $\mathbb{C}^{N}$ ) that satisfy (3.21) for some $\alpha \in \mathbb{N}, C>0$ and for all $\zeta \in V$. Consider then the inductive limit

$$
\mathcal{O}_{\psi}(V)=\underset{\alpha \rightarrow \infty}{\operatorname{ind} \lim } \mathcal{O}_{\psi_{\alpha}}(V)
$$

We have the following:
Proposition 3.13. Let $\omega \in \mathcal{W}^{\prime}$, $\wp$ a prime ideal of $\mathcal{P}$ with associated algebraic variety $V=V(\wp)$, and $K$ a closed convex subset of $\mathbb{R}^{N}$ with $\bar{K}=K$. Then we have a natural isomorphism:

$$
\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K}^{(\omega)}\right)^{\prime} \simeq \mathcal{O}_{\psi}(V)
$$

Proof. By (3.22) we have to prove the following isomorphism:

$$
\mathcal{O}_{\psi}\left(\mathbb{C}^{N}\right) / \wp(D) \otimes \mathcal{O}_{\psi}\left(\mathbb{C}^{N}\right) \simeq \mathcal{O}_{\psi}(V)
$$

First of all we prove that the homomorphism

$$
\begin{equation*}
\mathcal{O}_{\psi}\left(\mathbb{C}^{N}\right) / \wp(D) \otimes \mathcal{O}_{\psi}\left(\mathbb{C}^{N}\right) \rightarrow \mathcal{O}_{\psi}(V) \tag{3.23}
\end{equation*}
$$

is injective: if $f \in \mathcal{O}_{\psi}\left(\mathbb{C}^{N}\right)$ is zero on $V$, then by the Nullstellensatz there exist entire functions $f_{h}$ on $\mathbb{C}^{N}$ such that

$$
f(\zeta)=\sum_{h=1}^{r} p_{h}(-\zeta) f_{h}(\zeta) \quad \forall \zeta \in \mathbb{C}^{N}
$$

Since $f$ satisfies (3.21) by assumption, from the Ehrenpreis Fundamental Theorem [H, Thm. 7.7.13] (see also [B], G ] for more details), we can choose $f_{h}$ satisfying (3.21) too, hence $f_{h} \in \mathcal{O}_{\psi}\left(\mathbb{C}^{N}\right)$ and this implies that $f \in \wp \otimes \mathcal{O}_{\psi}\left(\mathbb{C}^{N}\right)$. So we have obtained that $f$ is the zero element of $\mathcal{O}_{\psi}\left(\mathbb{C}^{N}\right) / \wp(D) \otimes \mathcal{O}_{\psi}\left(\mathbb{C}^{N}\right)$, proving the injectivity of the homomorphism (3.23).

On the other hand, the homomorphism (3.23) is surjective: if $f \in \mathcal{O}_{\psi}(V)$, then $f \in \mathcal{O}\left(\mathbb{C}^{N}\right)$ and satisfies (3.21) for some $\alpha \in \mathbb{N}, C>0$ and for all $\zeta \in V$. By the Ehrenpreis Fundamental Theorem [H, Thm. 7.7.13], there exist $g \in \mathcal{O}\left(\mathbb{C}^{N}\right)$, with $f=g$ on $V$, and two constants $C^{\prime}>0$ and $n \in \mathbb{N}$ such that

$$
\sup _{\mathbb{C}^{N}}|g| e^{-\psi_{\alpha}-n \log (1+|\zeta|)} \leq C^{\prime} \sup _{V}|f| e^{-\psi_{\alpha}}
$$

Since the right-hand side is finite because f satisfies (3.21) on $V$, we have that

$$
|g(\zeta)| \leq C^{\prime \prime} e^{\psi_{\alpha}(\zeta)+n \log (1+|\zeta|)} \leq C^{\prime \prime \prime} e^{\psi_{\alpha^{\prime}}(\zeta)} \quad \forall \zeta \in \mathbb{C}^{N}
$$

for some $C^{\prime \prime}, C^{\prime \prime \prime}>0$ and $\alpha^{\prime} \in \mathbb{N}$. So $g \in \mathcal{O}_{\psi}\left(\mathbb{C}^{N}\right)$.
Proposition 3.13 will be crucial in the study of the homomorphism (3.12) related to the study of existence and/or uniqueness of solutions of the Cauchy problem (3.6).

To this aim we take $K_{1}$ and $K_{2}$ closed and convex sets, with $\overline{K_{j}}=K_{j}$ for $j=1,2$, and $K_{1} \subsetneq K_{2}$.
Then we define, for $j=1,2$ :

$$
\psi_{\alpha}^{j}(\zeta):=H_{K_{\alpha}^{j}}(\operatorname{Im} \zeta)+\alpha \omega(\zeta)
$$

for $K_{\alpha}^{j}$ compact convex set with $K_{\alpha}^{j} \subset \stackrel{\circ}{K}_{\alpha+1}^{j}$ and $\underset{\alpha}{\cup} K_{\alpha}^{j}=K_{j}$, for each $j=1,2$.
We consider the inductive limits

$$
\begin{equation*}
\mathcal{O}_{\psi^{j}}\left(\mathbb{C}^{N}\right):=\operatorname{ind}_{\alpha \rightarrow+\infty} \lim _{\mathcal{O}_{\alpha}^{j}}\left(\mathbb{C}^{N}\right), \quad j=1,2 \tag{3.24}
\end{equation*}
$$

From the above considerations we have the following:
Remark 3.14. The study of the homomorphism (3.12) is reduced to the study of the homomorphism

$$
\begin{equation*}
\mathcal{O}_{\psi^{1}}(V) \rightarrow \mathcal{O}_{\psi^{2}}(V) \tag{3.25}
\end{equation*}
$$

By Proposition 3.9 the existence of solutions of the Cauchy problem (3.6) is equivalent to the surjectivity of the homomorphism (3.11). But (3.11) has always a dense image, by the following:
Lemma 3.15. Let $\omega \in \mathcal{W}^{\prime}$, $\wp ~ a ~ p r i m e ~ i d e a l ~ a n d ~ K ~ K ~, ~ K ~ c l o s e d ~ c o n v e x ~ s u b s e t s ~ o f ~ \mathbb{R}^{N}$ with $K_{1} \subsetneq K_{2}, \overline{\check{K}_{j}}=K_{j}$ for $j=1,2$. Then the homomorphism

$$
\begin{equation*}
\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K_{2}}^{(\omega)}\right) \rightarrow \operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K_{1}}^{(\omega)}\right) \tag{3.26}
\end{equation*}
$$

has always a dense image.
Proof. By Lemma 3.12

$$
\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K_{1}}^{(\omega)}\right)^{\prime} \simeq \mathcal{E}_{(\omega)}^{\prime}\left(K_{1}\right) / \wp(D) \otimes \mathcal{E}_{(\omega)}^{\prime}\left(K_{1}\right)
$$

Let $T \in \operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K_{1}}^{(\omega)}\right)^{\prime}$ which vanish on

$$
\operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K_{2}}^{(\omega)}\right)=\left\{u \in W_{K_{2}}^{(\omega)}: p_{h}(D) u=0 \forall h=1,2, \ldots, r\right\}
$$

where $p_{1}(\zeta), \ldots, p_{r}(\zeta)$ are generators of $\wp$. We must prove that $T \equiv 0$.
By (3.16) we have that

$$
\hat{T}(\zeta)=T\left(e^{-i<\cdot, \zeta)}\right)=0 \quad \forall \zeta \in V
$$

moreover by the Nullstellensatz (cf. $[\mathrm{T}]$ ) and the Ehrenpreis Fundamental Theorem (cf. $[\mathrm{H}]$ ),

$$
T=\sum_{h=1}^{r} p_{h}(D) T_{h}
$$

for some $T_{h} \in \mathcal{E}_{(\omega)}^{\prime}\left(K_{1}\right)$, i.e. $T \in \wp(D) \otimes \mathcal{E}_{(\omega)}^{\prime}\left(K_{1}\right)$. This shows that $T$ is identically zero as an element of the space $\mathcal{E}_{(\omega)}^{\prime}\left(K_{1}\right) / \wp(D) \otimes \mathcal{E}_{(\omega)}^{\prime}\left(K_{1}\right) \simeq \operatorname{Ext}_{\mathcal{P}}^{0}\left(\mathcal{P} / \wp, W_{K_{1}}^{(\omega)}\right)^{\prime}$, and hence the homomorphism (3.26) has a dense image.

Remark 3.16. By Proposition 3.9 and Lemma 3.15, the Cauchy problem (3.6) admits at least a solution if and only if the homomorphism (3.11) has a closed image, i.e. if and only if the dual homomorphism (3.12) has a closed image, by [Gr, Ch. IV, § 2, n. 4, Thm. 3] (see also Remark 3.7).

By Proposition 3.13 we thus have that the Cauchy problem (3.6) admits at least a solution if and only if the homomorphism (3.25) has a closed image.

By Theorem 5.1 of BN3 this condition is equivalent to the validity of the following Phragmén-Lindelöf principle:

Theorem 3.17 (Phragmén-Lindelöf principle for holomorphic functions). Let $V$ be a reduced affine algebraic variety and $\mathcal{O}_{\psi^{1}}(V)$ and $\mathcal{O}_{\psi^{2}}(V)$ be defined as in (3.24). Then the following are equivalent:
(i) $\mathcal{O}_{\psi^{1}}(V) \hookrightarrow \mathcal{O}_{\psi^{2}}(V)$ has closed image;
(ii) $\forall \alpha \in \mathbb{N}, \exists \beta \in \mathbb{N}$ such that

$$
\mathcal{O}_{\psi^{1}}(V) \cap \mathcal{O}_{\psi_{\alpha}^{2}}(V) \subset \mathcal{O}_{\psi_{\beta}^{1}}(V)
$$

(iii) the following Phragmén-Lindelöf principle holds:

$$
(P h-L)_{O}\left\{\begin{array} { l } 
{ \forall \alpha \in \mathbb { N } , \exists \beta \in \mathbb { N } , C > 0 \text { such that } } \\
{ \text { if } f \in \mathcal { O } ( V ) \text { satisfies for some costants } \alpha _ { f } \in \mathbb { N } , c _ { f } > 0 }
\end{array} \left\{\begin{array}{l}
|f(\zeta)| \leq e^{\psi_{\alpha}^{2}(\zeta)} \quad \forall \zeta \in V \\
|f(\zeta)| \leq c_{f} e^{\psi_{\alpha_{f}}^{1}(\zeta) \quad} \quad \forall \zeta \in V \\
\text { then it also satisfies: } \\
|f(\zeta)| \leq C e^{\psi_{\beta}^{1}(\zeta)} \quad \forall \zeta \in V .
\end{array}\right.\right.
$$

Summarizing, by Remark 3.16 and Theorem 3.17 we have the following:
Theorem 3.18 (Phragmén-Lindelöf principle for the existence of solutions). Let $\omega \in \mathcal{W}^{\prime}$. The Cauchy problem (3.6) admits at least a solution if and only if the following Phragmén-Lindelöf principle holds for all $\wp \in \operatorname{Ass}(\mathcal{M})$ and $V=V(\wp)$ :

$$
(P h-L)_{O}\left\{\begin{array}{l}
\forall \alpha \in \mathbb{N}, \exists \beta \in \mathbb{N}, C>0 \text { such that } \\
\text { if } f \in \mathcal{O}(V) \text { satisfies for some costants } \alpha_{f} \in \mathbb{N}, c_{f}>0 \\
\left\{|f(\zeta)| \leq \exp \left\{H_{K_{\alpha}^{2}}(\operatorname{Im} \zeta)+\alpha \omega(\zeta)\right\} \quad \forall \zeta \in V\right. \\
|f(\zeta)| \leq c_{f} \exp \left\{H_{K_{\alpha_{f}}^{1}}(\operatorname{Im} \zeta)+\alpha_{f} \omega(\zeta)\right\} \quad \forall \zeta \in V \\
\text { then it also satisfies: } \\
|f(\zeta)| \leq C \exp \left\{H_{K_{\beta}^{1}}(\operatorname{Im} \zeta)+\beta \omega(\zeta)\right\} \quad \forall \zeta \in V
\end{array}\right.
$$

Let us now recall the definition of plurisubharmonic functions on an affine algebraic variety $V \subset \mathbb{C}^{N}$ :
Definition 3.19. A function $u: V \rightarrow[-\infty,+\infty)$ is called plurisubharmonic on $V$ if it is locally bounded from above, plurisubharmonic in the usual sense on $V_{\text {reg }}$, the set of all regular points of $V$, and satisfies

$$
u(\zeta)=\lim _{\substack{z \in V_{\text {reg }} \\ z \rightarrow \zeta}} u(z)
$$

at the singular points of $V$.
By $\operatorname{psh}(V)$ we denote the set of all functions that are plurisubharmonic on $V$.
By Theorem 1.2 of [BN2], Theorem 3.18 is equivalent to the following:
Theorem 3.20 (Phragmén-Lindelöf principle for plurisubharmonic functions). Let $\omega \in \mathcal{W}^{\prime}$. The Cauchy problem (3.6) admits at least a solution if and only if the following Phragmén-Lindelöf principle holds for all $\wp \in \operatorname{Ass}(\mathcal{M})$ and $V=V(\wp)$ :

$$
(P h-L)_{\mathrm{psh}}\left\{\begin{array}{l}
\forall \alpha \in \mathbb{N}, \exists \beta \in \mathbb{N}, C>0 \text { such that } \\
\text { if } u \in \operatorname{psh}(V) \text { satisfies for some costants } \alpha_{u} \in \mathbb{N}, c_{u}>0 \\
\left\{\begin{array}{l}
u(\zeta) \leq H_{K_{\alpha}^{2}}(\operatorname{Im} \zeta)+\alpha \omega(\zeta) \quad \forall \zeta \in V \\
u(\zeta) \leq H_{K_{\alpha}}^{1}(\operatorname{Im} \zeta)+\alpha_{u} \omega(\zeta)+c_{u}
\end{array} \quad \forall \zeta \in V\right. \\
\text { then it also satisfies: } \\
u(\zeta) \leq H_{K_{\beta}^{1}}(\operatorname{Im} \zeta)+\beta \omega(\zeta)+C \quad \forall \zeta \in V
\end{array}\right.
$$

Also the problem of existence of a unique solution of the Cauchy problem (3.6) can be easily treated by the study of the dual homomorphism (3.12). In particular, by Propositions 3.10 and 3.13 , we have:
Theorem 3.21. Let $\omega \in \mathcal{W}^{\prime}$. The Cauchy problem (3.6) admits one and only one solution if and only if, for all $\wp \in \operatorname{Ass}(\mathcal{M})$ and $V=V(\wp)$, the homomorphism

$$
\mathcal{O}_{\psi^{1}}(V) \hookrightarrow \mathcal{O}_{\psi^{2}}(V)
$$

is an isomorphism.
By Theorem 5.2 of [BN3] we can finally state the following:
Theorem 3.22. Let $\omega \in \mathcal{W}^{\prime}$. The Cauchy problem (3.6) admits one and only one solution if and only if, for all $\wp \in \operatorname{Ass}(\mathcal{M})$ and $V=V(\wp)$, one of the following equivalent conditions holds:
(i) $\mathcal{O}_{\psi^{1}}(V) \hookrightarrow \mathcal{O}_{\psi^{2}}(V)$ is an isomorphism;
(ii) $\forall \alpha \in \mathbb{N}, \exists \beta \in \mathbb{N}$ such that

$$
\mathcal{O}_{\psi_{\alpha}^{2}}(V) \subset \mathcal{O}_{\psi_{\beta}^{1}}(V)
$$

(iii) $\forall \alpha \in \mathbb{N}, \exists \beta \in \mathbb{N}, C>0$ such that

$$
\sup _{\zeta \in V}\left|f(\zeta) e^{-H_{K_{\beta}^{1}}(\operatorname{Im} \zeta)-\beta \omega(\zeta)}\right| \leq C \sup _{\zeta \in V}\left|f(\zeta) e^{-H_{K_{\alpha}^{2}}(\operatorname{Im} \zeta)-\alpha \omega(\zeta)}\right|
$$

for all $f \in \mathcal{O}(V)$.
Remark 3.23. Clearly condition (i) (resp. (ii), (iii)) of Theorem 3.22 implies condition (i) (resp. (ii), (iii)) of Theorem 3.17

Acknowledgments: The authors are grateful to Prof. R. Meise for his helpful suggestions about Theorem 2.46 and Lemma 3.11.
